

2016

Consumer Confidence Report

Ontario's annual water quality report takes you inside the world of your high-quality drinking water. This report is designed to provide important information about the source(s) of your water, what it contains, and how it compares to standards set by regulatory agencies.

The Ontario Municipal Utilities is pleased to report that during the past year, water delivered to your home or business meets or surpassed all state and federal drinking water requirements. Safe and reliable drinking water supplies are necessary for public health, fire protection, economic development, and the overall quality of life. Businesses and residents are encouraged to use the drinking water supplies as efficiently as possible.

Este informe contiene informacion muy importante sobre su agua potable. Tradúzcalo ó hable con alguien que lo entienda bien.

2016 CONSUMER CONFIDENCE REPORT

To ensure safe drinking water, public water systems must comply with Federal and State drinking water standards. The Ontario Municipal Utilities Company and its trained, certified water quality professionals collect thousands of water samples that are delivered to a State certified laboratory for analysis. We are pleased to report there were no water quality violations during 2016.

The public is encouraged to participate on issues concerning the City's water. Meetings of the Ontario City Council are scheduled on the first and third Tuesday of each month beginning at 6:30pm at Ontario City Hall, 303 East "B" Street, Ontario, CA 91761. Check the City's website at www.ontarioca.gov or call (909) 395-2000 for more information.

Para asegurar que el agua potable, los sistemas públicos de agua deben cumplir con las normas federales y estatales de agua potable. El Municipal Utilities Company Ontario y sus capacitados, certificados profesionales de la calidad del agua recogen miles de muestras de agua que se entregan a un laboratorio certificado por el estado para su análisis. Nos complace informar que no había violaciónes de calidad del agua durante el año 2016.

El público es alentado a participar en asuntos con respecto al agua de la Ciudad. Las reuniones del establecimiento de Ontario se programa el primer y tercer martes de cada mes a las 6:30 P.M., por la calle 303 "B" Street, Ontario. Para más información, vaya al Web site de la Ciudad www.ontarioca.gov o llame (909) 395-2000.

Regulatory Information

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

CONTAMINANTS THAT MAY BE PRESENT IN SOURCE WATER INCLUDE:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential
 uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes
 and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic
 systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the U.S. Environmental Protection Agency (USEPA) and the State Water Resources Control Board (State Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Nitrate

Nitrate in drinking water at levels above 10 mg/L is a health risk for infants of less than six months of age. Such nitrate levels in drinking water can interfere with the capacity of the infant's blood to carry oxygen, resulting in a serious illness; symptoms include shortness of breath and blueness of the skin. Nitrate levels above 10 mg/L may also affect the ability of the blood to carry oxygen in other individuals, such as pregnant women and those with certain specific enzyme deficiencies. If you are caring for an infant, or you are pregnant, you should ask advice from your health care provider.

Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Ontario Municipal Utilities Company is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

Total Coliform Rule

This Consumer Confidence Report (CCR) reflects changes in drinking water regulatory requirements during 2016. All water systems are required to comply with the state Total Coliform Rule. Beginning April 1, 2016, all water systems are also required to comply with the federal Revised Total Coliform Rule. The new federal rule maintains the purpose to protect public health by ensuring the integrity of the drinking water distribution system and monitoring for the presence of microbials (i.e., total coliform and *E. coli* bacteria). The U.S. EPA anticipates greater public health protection as the new rule requires water systems that are vulnerable to microbial contamination to identify and fix problems. Water systems that exceed a specified frequency of total coliform occurrences are required to conduct an assessment to determine if any sanitary defects exist. If found, these must be corrected by the water system.

Important Health Information

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

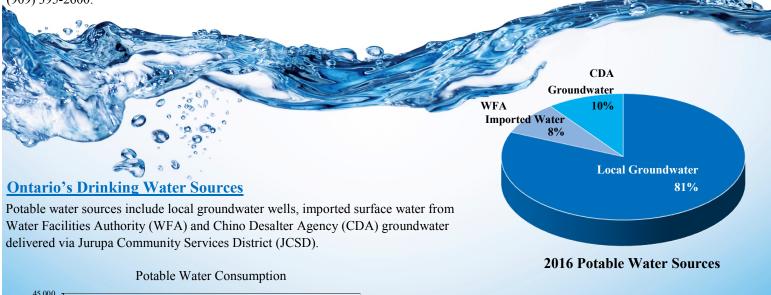

Kidney Dialysis /Aquariums

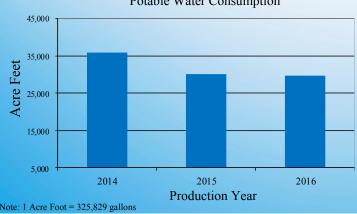

Customers who have unique water-quality needs and who use specialized home treatments, such as kidney dialysis machines, should make the necessary adjustments to remove chloramines. Customers who have fish tanks in their homes or businesses should also take precautions to remove chloramines prior to adding water to tanks.

Source Water Assessment

An assessment of the drinking water sources for the Ontario Municipal Utilities Company was completed in May 2002 and reviewed by the State Board in 2016. The sources are considered most vulnerable to the following activities associated with contaminants detected in the water supply: high density housing, sewer collection systems, parks, golf courses, the application of fertilizers, pesticides, and herbicides, metal plating, finishing and fabricating, wood pulp processing and paper mills, and recreational use of surface water sources.

A copy of the complete assessment is available at the State Water Resources Control Board, Division of Drinking Water, 464 West 4th Street, Suite 437, San Bernardino, CA 92401. You may request a summary of the assessment be sent to you by contacting the State Water Resources Control Board, Division of Drinking Water district engineer or an Ontario Municipal Utilities Company water system representative at (909) 395-2600.

Water Quality Monitoring

In 2016, the Ontario Municipal Utilities Company collected over 13,300 potable water samples to test for more than 150 possible constituents. Samples were collected at water sources and throughout the distribution system.

The following tables (pages 5-8) have been compiled for your information showing which constituents were detected in the City's drinking water during 2016 as compared to water quality standards.

Definitions

90th Percentile: The value in a data set in which 90 percent of the set is less than or equal to this value.

Disinfection By-Product: Compounds which are formed from mixing of organic or mineral precursors in the water with ozone, chlorine or chloramine. Total Trihalomethanes and Haloacetic Acids are disinfection by-products.

Locational Running Annual Average (LRAA):

The Running Annual Average(RAA) at one sample location.

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG):

The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency. **Maximum Residual Disinfectant Level**

(MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal

(MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Notification Level (NL): Notification levels are health –based advisory levels established by the State Board for chemicals in drinking water that lack maximum contaminant levels (MCLs).

Primary Drinking Water Standard (Primary Standard): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Public Health Goals (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Running Annual Average (RAA): The yearly average which is calculated every 3 months using the previous 12 months' data.

Secondary Drinking Water Standard (Secondary Standard): MCLs for contaminants that do not affect health but are used to monitor the aesthetics of the water.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Copper	ppb	[1300]	300	50	NA	90th percentile: 160 ppb (0 exceeded AL/ 51 samples)	Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives					
Lead	ppb	[15]	0.2	5	NA	90th percentile: ND (1 exceeded AL/ 51 samples)	Internal corrosion of household plumbing systems; discharges from industrial manufacturers; erosion of natural deposits					
UNREGULATED CO	NTAMIN.	ANT MONIT	TORING RUI	LE 3 (201	13 - 2015)							
1,1-Dichloroethane	ppb	5	3	[0.03]	Range Average	ND to 0.039 ND	Extraction and degreasing solvent; used in manufacture of pharmaceuticals, stone, clay and glass products; fumigant					
1,4-Dioxane	ppb	NA	NA	[0.07]	Range Average	ND to 0.42 0.16	Cyclic aliphatic ether; used as a solvent or solvent stabilizer in manufacture and processing of paper, cotton, textile products, automotive coolant, cosmetics and shampoos					
Bromochloromethane	ppb	[800]	NA	[0.06]	Range Average	ND to 0.11 ND	Agricultural defoliant or desiccant; disinfection byproduct; and used in production of chlorine dioxide					
Chlorate	ppb	NL =800	NA	[20]	Range Average	ND to 810 59	Byproduct of drinking water disinfection; Industrial process					
Chromium (total)	ppb	NA	NA	[0.2]	Range Average	ND to 6.3 1.3	Discharge from steel and pulp mills and chrome plating; erosion of natural deposits					
Hexavalent Chromium	ppb	10	0.02	[0.03]	Range Average	0.2 to 7.6 1.6	Discharge from electroplating factories, leather tanneries, wood preservation, chemical synthesis, refractory production, and textile manufacturing facilities; erosion of natural deposits					
Molybdenum	ppb	NA	NA	[1]	Range Average	ND to 8.1 1.9	Naturally-occurring element found in ores and present in plants, animals and bacteria; commonly used form molybdenum trioxide used as a chemical reagent					
Strontium	ppb	NA	NA	[0.3]	Range Average	220 to 560 350	Naturally-occurring element; historically, commercial use of strontium has been in the faceplate glass of cathode-ray tube televisions to block x-ray emissions					
Vanadium *DLR = 1.0 ppb for each HAA5 analyte exce	ppb	NL = 50	NA	[0.2]	Range Average	1.9 to 26 5.3	Naturally-occurring elemental metal; used as vanadium pentoxide which is a chemical intermediate and a catalyst					

^{*}DLR = 1.0 ppb for each HAA5 analyte except for monochloroacetic acid which has a DLR = 2.0ppb.

Unregulated contaminant monitoring helps USEPA and the State Water Resources Control Board to determine where certin contaminants occur and whether the contaminants need to be regulated.
