Intersection Summary

Cycle Length: 120  
 Actuated Cycle Length: 120  
 Natural Cycle: 110  
 Control Type: Actuated-Uncoordinated  
 Maximum v/c Ratio: 1.33  
 Intersection Signal Delay: 67.1  
 Intersection LOS: E  
 Intersection Capacity Utilization 107.9%  
 ICU Level of Service G  
 Analysis Period (min) 15

Splits and Phases: 9: Euclid Av. (SR-83) & E. Facility Dr./Merrill Av.

HCM 6th Signalized Intersection Summary  
 9: Euclid Av. (SR-83) & E. Facility Dr./Merrill Av.

Ontario Ranch Business Park (JN 13941)

**APPENDIX I2**  
**VEHICLE MILES TRAVELED ANALYSIS**

May 5, 2021

Mr. Kevin Thomas  
Kimley Horn and Associates, Inc.  
3880 Lemon Street, Suite 420  
Riverside, CA 92501

**SUBJECT: ONTARIO RANCH BUSINESS PARK VEHICLE MILES TRAVELED (VMT) ANALYSIS**

Dear Mr. Kevin Thomas:

The following VMT Analysis has been prepared for the proposed Ontario Ranch Business Park Project (**Project**), which is located on the northwest corner of Campus Avenue and Merrill Avenue, in the City of Ontario (San Bernardino County).

## **PROJECT OVERVIEW**

The proposed Project is assumed to include the following mix of land uses, which represent a reasonable mix of industrial and business park uses that would be permitted by the Project:

- Industrial: 913,053 square feet of high-cube fulfillment center warehouse use, 179,135 square feet of high-cube cold storage warehouse, and 320,551 square feet of general warehousing use.
- Business Park: 227,951 square feet of a mix of uses including merchant wholesale, professional services, professional office, warehouse/storage, and research and development uses (as would fall under ITE Land Use Code 130).
- **Total of 1,640,690 square feet**

## **BACKGROUND**

Changes to California Environmental Quality Act (CEQA) Guidelines were adopted in December 2018, which require all lead agencies to adopt VMT as a replacement for automobile delay-based level of service (LOS) as the measure for identifying transportation impacts for land use projects. This statewide mandate went into effect July 1, 2020. To aid in this transition, the Governor's Office of Planning and Research (OPR) released a Technical Advisory on Evaluating Transportation Impacts in CEQA (December of 2018) (**Technical Advisory**). (1) Based on OPR's Technical Advisory, the San Bernardino County Transportation Authority (SBCTA) prepared Recommended Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment (**SBCTA Guidelines**) (2), which provided each of its member agencies a template for the development of VMT screening criteria, analysis methods and impact thresholds. The City of Ontario using both the Technical Advisory and SBCTA Guidelines developed their own transportation impact guidelines, which were adopted by City Council on June 16 2020 (**City Guidelines**). (3) This VMT analysis has been developed based on the adopted City Guidelines.

## PROJECT SCREENING

Projects that meet certain VMT screening criteria may be presumed to result in a less than significant transportation impact, which is consistent with the approach suggested in OPR's Technical Advisory. The screening criteria adopted by the City of Ontario are generally consistent with guidance identified in the Technical Advisory. The City of Ontario lists the following VMT screening criteria<sup>1</sup>:

- Low VMT Area Screening
- Low Trip Generating Uses Screening
- Transit Priority Area (TPA) Screening
- Project Type Screening

A land use project need only meet one of the above screening criteria to result in a less than significant impact.

### **LOW VMT AREA SCREENING**

City Guidelines state that projects may be presumed to have a less than significant VMT impact if located in low VMT generating model traffic analysis zones (TAZs) that generate total daily VMT per service population that is 15% less than the baseline level for the County.<sup>2</sup> The SBCTA screening tool was utilized to determine low areas of VMT within the City of Ontario. The screening tool uses the sub-regional San Bernardino Transportation Analysis Model (SBTAM) to measure VMT performance within individual TAZ's throughout the region. Parcel(s) containing the proposed Project were selected and the screening tool was run for the Origin/Destination (OD) VMT per service population (SP) measure of VMT. The results of the screening tool for the OD VMT per SP calculations are provided in Attachment A, which indicates that the Project resides within TAZ 53653301 that is not within a low VMT generating zone.

**The Low VMT Area screening threshold is not met.**

### **LOW TRIP GENERATING USES SCREENING**

The City Guidelines indicate that small development projects generating fewer than 110 daily vehicle trips or less may be presumed to have a less than significant impact, subject to discretionary approval by the City. Trips generated by the Project's proposed land uses have been estimated based on trip generation rates collected by the Institute of Transportation Engineers (ITE) Trip Generation Manual, 10<sup>th</sup> Edition, 2017. (4) Based on information contained in the Project's LOS based traffic analysis report, the Project is anticipated to generate more than 110 daily trips. (5)

**The Low Trip Generating Uses screening threshold is not met.**

---

<sup>1</sup> City of Ontario Vehicle Miles Traveled Analysis Thresholds for CEQA (SB 743); Page 1

<sup>2</sup> City Guidelines; Exhibit A.

## **TPA SCREENING**

Consistent with guidance identified in the City Guidelines, projects located within a Transit Priority Area (TPA) (i.e., within ½ mile of an existing “major transit stop”<sup>3</sup> or an existing stop along a “high-quality transit corridor”<sup>4</sup>) may be presumed to have a less than significant impact absent substantial evidence to the contrary. However, the presumption may not be appropriate if a project:

- Has a Floor Area Ratio (FAR) of less than 0.75;
- Includes more parking for use by residents, customers, or employees of the project than required by the jurisdiction (if the jurisdiction requires the project to supply parking);
- Is inconsistent with the applicable Sustainable Communities Strategy (as determined by the lead agency, with input from the Metropolitan Planning Organization); or
- Replaces affordable residential units with a smaller number of moderate- or high-income residential units.

The Project site is not located within ½ mile of an existing major transit stop, or along a high-quality transit corridor.

**The TPA screening threshold is not met.**

## **PROJECT TYPE SCREENING**

The City Guidelines identify that local serving retail less than 50,000 square feet or other local serving essential services (e.g., day care centers, public schools, medical/dental office buildings, etc.) are presumed to have a less than significant impact absent substantial evidence to the contrary. In addition, small projects anticipated to generate low traffic volumes and by association low greenhouse gas (GHG) emissions are also assumed to cause a less than significant impact. The Project consists of industrial and business park uses, which do not typically consist of local-serving or essential services.

**The Project Type screening threshold is not met.**

## **PROJECT GENERATED VMT**

The City Guidelines state that projects not screened from VMT analysis based on their location or land use type should conduct VMT forecasting through the SBTAM travel demand model to determine if the project would result in a significant VMT impact. SBTAM is a useful tool to calculate VMT as it considers interaction between different land uses based on socio-economic data such as population, employment

---

<sup>3</sup> Pub. Resources Code, § 21064.3 (“‘Major transit stop’ means a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.”).

<sup>4</sup> Pub. Resources Code, § 21155 (“For purposes of this section, a high-quality transit corridor means a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.”).

and other factors, is identified in the City Guidelines as the appropriate travel forecasting tool for conducting VMT analysis in the City of Ontario.

Project generated VMT has been calculated using the most current version of SBTAM, which was updated by SBCTA as part of the development of their recommended VMT guidelines. Adjustments to socio-economic data (SED) (i.e., project employment levels) have been made to the appropriate TAZ. A separate TAZ is used to isolate project generated VMT from other land uses in the model. Table 1 summarizes the employment estimates for the Project.

**TABLE 1: SED ESTIMATES**

Land Use	% Mixture	Employees/TSF	Total TSF	Estimated Employment
Business Park	Non-Office (50%)	0.650	227.951	74
	Office (50%)	2.860		326
Industrial	Non-Office (90%)	0.650	1,412.739	826
	Office (10%)	2.860		404
<b>Total</b>			<b>1,640.690</b>	<b>1,630</b>

Because the tenant of the Project’s buildings are not yet known, the number of employees that the Project would generate cannot be precisely determined; therefore, for purposes of this analysis, employment estimates were calculated using employment density factors of 0.65 employees/thousand square feet (TSF) for non-office portions and 2.86 employees/TSF for office portions of industrial and business park uses consistent with the Ontario General Plan Buildout Methodology document (April 2015)<sup>5</sup>. Based on these employment generation rates; the Project is expected to generate approximately 1,630 employees. Project employment was added to the Project’s TAZ in both the base year model (2016) and the cumulative year model (2040). The base year model and cumulative year model were then run inclusive of the Project’s employment estimate.

The City has chosen the OD method of calculating VMT for purposes of establishing their impact threshold. The OD method of calculating VMT includes all vehicle trips and trip purposes (i.e., passenger cars and heavy trucks). Project generated VMT using the OD trip matrix from SBTAM was calculated for both the base year model (2016) and cumulative year model (2040), and linear interpolation was used to determine the Project’s baseline (2021) VMT value. The VMT value was then normalized by dividing by the Project’s SP, which in this case is the number of Project employees. Table 2 presents the key inputs for the calculation of project generated VMT per SP.

**TABLE 2: PROJECT VMT PER SP**

	Base Year (2016)	Cumulative (2040)	Baseline (2021)
Project generated VMT	71,583	68,460	70,579
SP	1,630	1,630	1,630
Project VMT per SP	43.92	42.00	43.30

The City of Ontario has selected a threshold based on the General Plan Buildout VMT performance in the City. More specifically, the City Guidelines state that a significant impact would occur if the project VMT per SP exceeds the Citywide average VMT per SP under General Plan Buildout Conditions.

Table 3 presents a comparison between baseline project generated VMT per SP to the City’s impact threshold. As shown, the baseline project generated VMT per SP is 43.30 or 19.61% above the City’s threshold.

**TABLE 3: PROJECT VMT IMPACT DETERMINATION**

	Baseline (2021)
Project VMT per SP	43.30
General Plan Buildout VMT per SP	36.20
Percent Change	+19.61%
Potentially Significant?	Yes

**PROJECT’S CUMULATIVE EFFECT ON VMT**

Consistent with City Guidelines, projects that are found to have a potential impact using efficiency-based metrics (such as VMT per SP) should also provide an additional assessment to evaluate a project’s effect on VMT. This analysis is performed using the boundary method, which includes all vehicle trips with one or both trip-ends within a specific geographic area of interest (i.e., City of Ontario). As shown on Table 4, the Project is anticipated to result in an increase in total VMT within the City of Ontario for General Plan Buildout conditions.

**TABLE 4: CUMULATIVE NET CHANGE IN CITYWIDE VMT**

	General Plan Buildout (2040) No Project	General Plan Buildout (2040) With Project
VMT	8,992,608	9,008,768

## POTENTIAL VMT REDUCTION STRATEGIES

Consistent with City Guidelines, VMT reduction strategies should be considered to address project generated VMT that exceeds the City's adopted impact threshold. Transportation demand management (TDM) strategies have been evaluated for the purpose of reducing VMT impacts determined to be potentially significant. The effectiveness of TDM strategies to reduce VMT has been determined based on the SB 743 Implementation Mitigation and TDM Strategy Assessment (November 11, 2019, Fehr & Peers) prepared for SBCTA (**SBCTA TDM Report**), which was based on a regionally focused assessment of the previously published Quantifying Greenhouse Gas Mitigation Measures (CAPCOA, 2010) for its applicability to land use projects within the SBCTA region. The SBCTA TDM Report indicates that of the 50 transportation measures presented by CAPCOA, only 41 of those measures are applicable at a building and site level. The remaining 9 measures are functions of, or depend on, site location and/or actions by local and regional agencies or funders.<sup>6</sup>

Based on a review of the 41 transportation measures identified by CAPCOA, the SBCTA TDM Report identifies that only 7 of those measures may be effective at the project level. Land use context is a major factor relevant to the potential application and effectiveness of TDM measures. More specifically, the land use context for the area in which the Project resides is characteristically suburban<sup>7</sup>. Based on a review of the potentially relevant TDM measures presented in the SBCTA TDM Report, the following 7 TDM measures identified by the SBCTA TDM Report were evaluated for their applicability to the Project based on its suburban context and their ability to reduce project generated VMT:

- ***Measure 1: Increase Diversity of Land Uses (LUT-3).*** Having different types of land uses near one another can decrease VMT since trips between land use types are shorter and may be accommodated by non-auto modes of transportation. For example, when residential areas are in the same neighborhood as retail and office buildings, a resident does not need to travel outside of the neighborhood to meet his/her trip needs.

***Remarks:*** The Project proposes the construction of 1,640,690 square feet of industrial and business park use. In order for the above measure to apply, at least 3 of the following land uses should be located on-site, or if not on-site then within ¼ mile or less of the Project: residential development, retail development, office development, park, or open space. As the proposed Project does not include a diverse mix of land uses on-site, and is not located within a ¼ mile of 3 of the land uses listed above, this particular TDM measure is therefore not evaluated further as a means of providing a reduction in Project VMT.

It is, however, recognized that the Project would introduce additional employment opportunities, acting to generally improve the City and region jobs/housing balance. The resulting improved jobs/housing balance could reduce area commute VMT. This analysis, however, conservatively assumes no such VMT reduction.

- ***Measure 2: Provide Pedestrian Network Improvements (SDT-1).*** Providing on-site pedestrian access network to link areas of the Project to the off-site pedestrian network encourages people to walk for short trips instead

---

<sup>6</sup> Measures obtained from SBCTA TDM report, p. 5.

<sup>7</sup> **Suburban:** Characterized by dispersed, low intensity, single use, automobile dependent land use patterns, usually outside of the central city (a suburb). (*Quantifying Greenhouse Gas Mitigation Measures*, p. 60).

of drive. This mode shift results in people driving less for nearby trips (typically less than ¼ mile and no greater than ½ mile) and thus a reduction in VMT.

Remarks: Although there are existing sidewalks off-site along portions of Merrill Avenue, field observations conducted at the time the Project's level of service analysis (i.e., traffic study) was prepared indicate there is nominal pedestrian activity in the study area likely due to the lack of pedestrian connections and a limited diversity of land uses. The Project would build pedestrian walkways within the site area connecting development and extending those sidewalk connections to the roadway adjacent pedestrian walkways. The potential reduction in VMT is limited with a maximum reduction 2.0 percent for pedestrian accommodations within the Project site and connecting off-site, as noted by CAPCOA (Quantifying Greenhouse Gas Mitigation Measures, p. 187).

- Measure 3: Provide Traffic Calming Measure (SDT-2). Providing traffic calming measures encourages people to walk or bike instead of using a passenger car. This mode shift would result in a decrease in VMT. Traffic calming features may include marked crosswalks, count-down signal timers, curb extensions, speed tables, raised crosswalks, raised intersections, median islands, tight corner radii, roundabouts or mini-circles, on-street parking, planter strips with street trees, chicanes/chokers, and others.

Remarks: Given the industrial nature of the Project and similar characteristics of surrounding uses, there is limited opportunity for pedestrian and bicycle activity. This measure is therefore not evaluated further as means of providing a reduction in Project VMT.

- Measure 4: Implement Car-Sharing Program (TRT-9). Implementing a car-sharing program would allow individuals to have on-demand access to a shared fleet of vehicles on an as-needed basis. User costs are typically determined through mileage or hourly rates, with deposits and/or annual membership fees.

Remarks: It is possible that employers within the Project site could implement car-sharing programs. This may provide car access for employees on an as-needed basis, and thereby alleviate some of the costs and responsibilities of individual car ownership. However, this would not necessarily result in a reduction in VMT but would rather transfer the VMT source from individually-owned autos to employee-subsidized autos. The potential reduction in VMT is also extremely limited with a maximum reduction in VMT between 0.4 – 0.7 percent as noted by CAPCOA (Quantifying Greenhouse Gas Mitigation Measures, p. 245), therefore, this measure is not evaluated further as a means of providing a reduction in Project VMT.

- Measure 5: Increase Transit Service Frequency and Speed (TST-4). This measure serves to reduce transit-passenger travel time through more reduced headways and increased speed and reliability. This makes transit service more attractive and may result in a mode shift from auto to transit which reduces VMT.

Remarks: The study area is currently served by Omnitrans, a public transit agency serving various jurisdictions within San Bernardino County. No bus routes currently provide proximate service (within one-quarter mile) of the Project site. Transit service is reviewed and updated periodically to address ridership, budget and community demand needs. Changes in land use can affect these periodic adjustments which may lead to either enhanced or reduced service where appropriate. It is recommended that the applicant work in conjunction with the Lead Agency and Omnitrans to coordinate potential bus service to the Project site. Since implementation of this strategy would require agency implementation it is not applicable for individual development projects. This measure is therefore not evaluated further as means of providing a reduction in Project VMT.

- Measure 6: Encourage Telecommuting and Alternative Work Schedule (TRT-6). Encouraging telecommuting and alternative work schedules reduces the number of commute trips and therefore VMT traveled by employees. Alternative work schedules could take the form of staggered starting times, flexible schedules, or compressed work weeks.  
*Remarks:* The effectiveness of this measure is dependent on the ultimate building tenant(s) which are unknown at this time. This measure could provide for a potential reduction in Project VMT. CAPCOA notes that implementation of this measure could reduce commute VMT by 0.07 – 5.50 percent (Quantifying Greenhouse Gas Mitigation Measures, p. 236).
- Measure 7: Provide Ride-Sharing Programs (TRT-3). This strategy focuses on encouraging carpooling and vanpooling, but its ultimate implementation is limited similarly as Measure 6 above.  
*Remarks:* The effectiveness of this measure is dependent on the ultimate building tenant(s) which are unknown at this time. This measure could provide for a potential reduction in Project VMT. CAPCOA notes that implementation of this measure could reduce commute VMT by 1.0 – 15.0 percent (Quantifying Greenhouse Gas Mitigation Measures, p. 227).

The effectiveness of the above-noted TDM measures would be dependent building occupancies, which are unknown at this time. Beyond Project tenancy considerations, land use context is a major factor relevant to the potential application and effectiveness of TDM measures. More specifically, the land use context of the Project is characteristically suburban. Of itself, the Project's suburban context acts to reduce the range of feasible TDM measures and moderates their potential effectiveness.

It is also recognized that as the Project area and City develop as envisioned under the City of Ontario Policy Plan, new residential, commercial/retail, and industrial development would be implemented. These actions could collectively alter transportation patterns, improve the City's jobs/housing ratio, diminish VMT/SP, and support implementation of new or alternative TDM measures. There is no means however to quantify any VMT reductions that could result. Additionally, the effectiveness of the TDM strategies that have potential to reduce the Project VMT/SP are dependent on as yet unknown final Project building tenant(s). Further, the identified TDM measures are not likely to reduce Project truck VMT. Pointedly, CAPCOA provides no TDM measures targeted at truck traffic.

## CONCLUSION

In summary, the Project was found to exceed the City's adopted VMT threshold by 19.61%. Reductions in commute VMT through feasible TDM measures such as those described previously will be provided by the Project. Inclusion of such VMT reduction measures in areas that are characteristically suburban<sup>8</sup> in context are noted to be limited to a maximum VMT reduction of 15%,<sup>9</sup> which is not enough to reduce

project generated VMT to a level below the City's adopted threshold. Finally, as future Project design features and building tenants are not yet known, reductions in VMT related to the above TDM measures cannot be accurately estimated or guaranteed. Therefore, the Project's transportation impact based on VMT should conservatively be considered **significant and unavoidable**.

## Introduction

This document prepared for the City of Ontario (City) is a Water Supply Assessment (WSA) intended to meet the requirements of Senate Bill (SB) 610. The water demand for the Ontario Ranch Business Park Specific Plan Amendment (“proposed Project or Project”) is calculated and the adequacy of water supplies to meet the proposed Project is evaluated.

SB 610 established the primary legal standards for assessing the sufficiency of water supplies for new development projects. These statutes require as part of the environmental review conducted for a qualifying project pursuant to the California Environmental Quality Act (CEQA), the public water supplier or land use agency – in this case the City – must prepare a “water supply assessment” of the reliability of water supplies for the Project, considering normal, single dry, and multiple dry years over a 20-year horizon. The basic requirement is that a WSA must “include a discussion with regard to whether the public water system’s total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed Project, in addition to the water system’s existing and planned future uses, including agricultural and manufacturing uses.”<sup>1</sup>

## Site Location and Project Description

The Project area is located within the City’s Ontario Ranch area (formerly known as New Model Colony), which comprises a portion of the former San Bernardino County Agricultural Preserve annexed by the City in 1999. Ontario Ranch is among the last significant underdeveloped areas in the San Bernardino Valley. The proposed Project is an extension of the Ontario Ranch Business Park Specific Plan project (Approved SP), and is an eastern expansion consisting of 72 acres, in the southwest portion of the City. The proposed Project consists of eight parcels and is bound by Eucalyptus Avenue to the north, Merrill Avenue to the south, Sultana Avenue to the west, and Campus Avenue to the east (refer to **Figure 1, Vicinity Map**). Furthermore, pursuant to the Housing Accountably Act, or Senate Bill 330 (SB330), the Project will create an Overlay District on an “SB330 Replacement Site” to increase the residential zoning capacity by 479 units, which will offset the “loss” of residential zoning capacity within the Project site. In addition, this SB330 Replacement Site is also being evaluated for substantial additional density (beyond what is required for this Project’s SB330 compliance) as part of the City’s The Ontario Plan (TOP) 2050 Update EIR and also as part of the City’s Housing Element Update EIR, both of which are planned for City Council approval in 2022.

Regional access to the Project site is provided by State Route 83 (SR-83; Euclid Avenue), which connects to State Route 60 (SR-60) and Interstate 10 (I-10) to the north, Interstate 15 (I-15) approximately 5.75 miles to the east, and State Route 71 (SR-71) approximately 3 miles to the southwest. SR-71 connects the project to Interstate 91 (I-91) in unincorporated Riverside County.

---

<sup>1</sup> California Water Code Section 10910(c)(3).

The Approved SP was approved in September of 2020 and consisted of a General Plan Amendment (GPA), Specific Plan, Development Plan Review, Tentative Parcel Map, and a Development Agreement to allow for development of an Industrial and Business Park on eleven parcels covering 85.6 acres in the City. The Approved SP project included eight warehouse buildings totaling a maximum development of 1,905,027 square feet (SF) of warehouse and office uses. The proposed Project would incorporate the abutting approximately 72 acres to the east of the Approved SP site into the overall SP area.

The “Project” to be addressed is an extension, or Phase 2, of the Approved SP. The Project will allow for the development of approximately 1.6 million SF of Business Park and Industrial land uses on the 72-acre site, as described further below. The Project consists of two planning areas (PAs). PAs 3 and 4 are comprised of Business Park and Industrial development and would allow a total of 227,951 SF of Business Park and 1,412,739 SF of Industrial uses. The Project site is depicted in **Figure 2, Proposed Land Use Map**, and will be evaluated with the total maximum allowable development in the Project SP and associated onsite and offsite infrastructure improvements.

The Project site is currently developed as an operational dairy farm. The northeastern portion of the site is developed with cattle pens with multiple canopy structures, farmhouses, and structures associated with milking activities. The buildings appear to be single-story structures of wood frame construction and the canopies appear to be of metal frame construction. The northwestern portion and southern one-third of the site are planted with row crops. To the north, east, and west of the proposed Project site exists mostly rural farmland, and to the south is the Chino Airport. Furthermore, the Project proposes a comprehensive land use plan, circulation plan, streetscape plan, infrastructure service plan, grading plan, maintenance plan, phasing plan, design guidelines, development regulations, and implementation measures to guide the development of the 72-acre Project site into a master-planned business/industrial park. The Project includes a GPA, Specific Plan Amendment (SPA), a Development Agreement, Development Plan(s), and Tentative Parcel Map(s) to allow development of the two PAs which would accommodate a variety of industrial-serving commercial, low-intensity office, technology, light manufacturing, and warehouse/distribution uses that are compatible with the Project site’s location within the Ontario Ranch area. Refer to **Figure 2, Proposed Land Use Map**.

The Project would allow up to 1,640,690 SF of building space for these PAs. PAs 3 and 4 would place three buildings along Eucalyptus Avenue frontage and the remaining three buildings north of Merrill Avenue, along the Sultana Avenue frontage (west) and Campus Avenue (east).

The land use types proposed by the Project are summarized below in Table 1, Proposed Project Land Use.

**Table 1 – Proposed Project Land Use**

<b>Planning Area<sup>1</sup></b>	<b>Maximum Floor Area Ratio<sup>2</sup></b>	<b>Site Acreage</b>	<b>Maximum Building Square Footage</b>
<b>Phase 3</b>			
Planning Area 3: Business Park	0.45	11.63	227,951 SF
Planning Area 4: General Industrial	0.54	60.06	1,412,739 SF
<b>TOTAL</b>		<b>71.69</b>	<b>1,640,690 SF</b>
a. Phase 1 and 2 are a part of the Approved SP. b. Provided the GPA application submitted in conjunction with this Specific Plan to designate PAs 3 as Business Park and PAs 4 as General Industrial is approved. c. The Project EIR as proposed is reviewing square footages below the maximum TOP thresholds. The FAR may be increased to the TOP max levels of 0.60 and 0.55 for BP and IG respectively with a Specific Plan Amendment and appropriate CEQA analysis. d. PA 3 is rounded from 11.629 and PA 4 is rounded from 60.059

## Water Supply Assessment

### Water Purveyor

The Ontario Municipal Utilities Company (OMUC) provides water service to residents, businesses, and other users in the City, including the Project site. Two small areas in the north central and northeastern sections of the City are served by the Cucamonga Valley Water District (CVWD). As of 2020, OMUC provided water to a population of approximately 178,409 people. The primary source of water is groundwater from Chino Groundwater Basin (Chino Basin). Other water supplies include treated groundwater from the Chino Basin Desalter Authority (CDA), recycled water from Inland Empire Utilities Agency (IEUA), imported water from the Water Facilities Authority (WFA), and purchased water from the San Antonio Water Company (SAWCo).

The City has already inactivated several wells (Well 3, 4, 9, 15, 31, 35, and 50) due to high nitrate and perchlorate concentrations detected above the maximum contaminant levels (MCL). Well 34 was removed from service due to (TCP) water quality issues. The operations of Wells 44 and 52 are limited due to the migration of the bacterial groundwater plume when these wells are used too frequently. Well 25 was taken out of service due to a Perfluorooctanoic acid (PFOA) detection, which was below the PFOA interim notification level. The impact on supply due to the closure of these wells is minimized by constructing replacement wells at other locations where contaminant levels are low and constructing wellhead treatment facilities.

Total potable and recycled water demand within the OMUC service area averaged 39,921 acre-feet per year (AFY) at year 2020.<sup>2</sup> Potable water demands averaged 32,109 AFY and recycled water demands averaged 7,812 AFY. Over the past ten years, the City's total water demands (including potable and recycled water demands) have ranged from 36,036 AFY to 45,196 AFY, with an average of 40,831 AFY. In addition, the City recently experienced a five-consecutive-year-drought within its service area from FY 2011-12 to FY 2015-16. Throughout this consecutive dry year period, the City's annual water production ranged from 42,603 AFY (2012) to 36,036 AFY (2016, with an average of approximately 41,558 AFY. In the City's Single-Dry year, annual water production was 43,346. In 2020, the City's total demand was 39,921 AFY. The total water supply (potable and non-potable) demands in the year 2045 are projected to be 73,668 AFY. Potable water demands are projected to be 57,609 AFY and recycled water demands are projected to be 16,059 AFY.

The passage of SB X7-7 (also known as the Water Conservation Act of 2009) resulted in increased efforts to reduce potable water usage by requiring all California urban water suppliers to achieve a 20% reduction in demands (from a historical baseline) by 2020. Using a 10-year base period of 1995 to 2004, the City's baseline water usage is 245 gallons per capita per day (GPCD). The City's actual water use rate during FY 2019-20 was 161 GPCD which is a decrease of up to 103 GPCD from the recent historical water use. The 2020 target was 196 GPCD.<sup>3</sup>

It is required that every urban water supplier assess the reliability to provide water service to its customers under normal, single dry, and multiple dry years. As discussed in the City's Urban Water Management Plan (UWMP), the City is capable of meeting the water demands of its customers in normal, single dry, and multiple dry years between 2020 and 2045.

## Legal Requirements

SB 610 established the primary legal standards for assessing the sufficiency of water supplies for new development projects. Affected land developments are those that meet certain size thresholds. The proposed Project meets the threshold for a proposed industrial, manufacturing, processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 SF of floor area. The proposed Project also meets the threshold for a proposed commercial office building employing more than 1,000 persons or having more than 250,000 SF of floor space. Therefore, the proposed Project, as described in Section 1.2, meets the criteria for preparation of a WSA.

The basic requirement is that a WSA must “include a discussion with regard to whether the public water system’s total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed Project, in addition to the water system’s existing and planned future uses, including agricultural and manufacturing uses.” If the water demand for a proposed Project is accounted for in an adopted UWMP, as is the case here, the WSA preparer may incorporate that information into the WSA.

The WSA also requires additional analysis if any portion of the water purveyor's water supplies include groundwater. A description of any groundwater basin or basins from which the proposed Project will be supplied in addition to a detailed description and analysis of the amount and location of groundwater pumped by the public water system for the past five years should be provided. The WSA should also include an analysis of the sufficiency of the groundwater from the basin or basins from which the proposed Project will be supplied to meet the projected water demand associated with the proposed Project.

Upon adoption, the WSA is incorporated into the CEQA document being prepared for the Project, and the lead agency must determine, based on the entire record, whether projected water supplies will be sufficient to satisfy demands for the Project, in addition to existing and future uses.<sup>4</sup>

## Water Demand Analysis

This section evaluates whether the proposed Project was included in the projection of future water demands for the City, as described in the 2020 UWMP. As per Section 10910 (c) (2) of the California Water Code:

“if the projected water demand associated with the proposed Project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).”

### City of Ontario Water Demands

The primary source of water for the proposed Project would be existing water supplies used by the City to provide service to its customers. This section analyzes the water demands of existing and planned future City customers.

Current and projected potable and recycled water demands by customer class are presented in Tables 2 and 3. The City’s total 2020 demand was 39,921 AFY. Potable water demand was 32,109 AFY and recycled

---

<sup>4</sup> California Water Code Section 10910 (b) and (c).

water demand was 7,812 AFY. The projected 2045 potable water demand is 57,609 AFY and recycled water demand is 16,059 AFY for a total of 73,668 AFY. Actual water supplies provided to the City for the fiscal year 2019-2020 are summarized in **Table 2**.

**Table 2: Water Supplies Summary (AF)**

Water Supplier	Water Source	Amount (AFY)
City of Ontario	Groundwater	18,395

## Proposed Project Water Demand

The proposed Project consists of an approximately 72-acre development within the boundaries of the proposed Project. The proposed Project plans for new business and industrial uses. Buildout of the Project

would generate a total of 1,640,690 SF of building space, which includes 227,951 SF of Business Park and 1,412,739 SF of industrial use. The proposed development would connect to the City’s water main for domestic water use. Recycled water would be used for landscape irrigation.

The Project site is currently agricultural land use, including dairy operations and field crops. The site is not connected to the City’s water supply and utilizes groundwater for irrigation of crops and other agricultural. To the north, east, and west of the proposed Project site exists mostly rural farmland, and to the south is the Chino Airport.

Water use for the proposed Project was calculated using domestic water demand rates and recycled water irrigation demand rates, as specified in the UWMP. **Table 5** shows the total water demand estimate for the proposed development.

**Table 5 – Water Demand Estimate for the Proposed Development**

Land Use	Acres	Domestic Water Demand Rate <sup>a</sup> (gpd/ac)	Total Domestic Water Usage (gal/day)	Recycled Water Demand Rate <sup>b</sup> (gpd/ac)	Total Recycled Water Usage (gal/day)
<b>Planning Area</b>					
PA 3: Business Park	11.629	1,800	20,932	1,200	13,955
PA 4: Industrial	60.059	1,400	84,083	1,700	102,100
<b>Total</b>	<b>71.688</b>	-	<b>105,015</b>	-	<b>116,055</b>
Source: City of Ontario 2020 UWMP, 2020.					
a. Table 4-8 of the Potable Water Master Plan Update (Appendix E of the 2020 UWMP) was used to establish the domestic water demand rate.					
b. Table 5-3 of the Recycled Water Irrigation Unit Demand Factors (Appendix K of the 2020 UWMP) was used to establish the recycled water demand rate.					

As shown in **Table 5**, the total domestic water demand within the Project area is estimated to be 105,015 gal/day (116.8 AFY). The total recycled water usage is estimated to be 116,055 gal/day (131.4 AFY). The total water demand would be **221,070 gal/day** or **248.2 AFY**.

### Proposed Project with Respect to 2020 Urban Water Management Plan

In order to evaluate water supply reliability, California statutes require the consideration of water supplies and demands in three types of water conditions: normal, single dry, and multiple dry water years.<sup>5</sup> The 2020 UWMP indicates that the City is capable of meeting the water demands of its customers in normal, single dry, and multiple dry years between 2020 and 2045.

The 2020 UWMP projected water demands are based on future land uses as specified in the City’s latest 2010 General Plan. Based on the projected future land use for the Project site in the UWMP, the water demand was estimated, as shown in **Table 6**.

<sup>5</sup> Department of Water Resources, 2005. *California Water Plan, Bulletin 160-05, Volume III* (“Each district has different assumptions and policies that guide their planning”).

**Table 6 – Water Demand Estimate for the current land uses based on Projected Future Land Use in 2020 UWMP**

Land Use	Acres	Domestic Water Demand Rate <sup>a</sup> (gpd/ac)	Total Domestic Water Usage (gal/day)	Recycled Water Demand Rate <sup>b</sup> (gpd/ac)	Total Recycled Water Usage (gal/day)
Business Park	18.10	1,800	32,580	1,200	21,720
Low Medium Density Residential	56.34	3,960	223,106	700	39,438
<b>Total</b>	<b>74.44</b>	-	<b>255,686</b>	-	<b>61,158</b>

Source: City of Ontario 2020 UWMP.  
a. Table 4-8 of the Potable Water Master Plan Update (Appendix E of the 2020 UWMP) was used to establish the domestic water demand rate.  
b. Table 5-3 of the Recycled Water Irrigation Unit Demand Factors (Appendix K of the 2020 UWMP) was used to establish the recycled water demand rate.

Comparing Project water demand in **Table 5** with water demand assumed in the 2020 UWMP as shown in **Table 6** shows that the total domestic water demand within the site area will decrease, compared to planned land use as depicted in the 2020 UWMP. Water usage of existing land uses per the 2020 UWMP is estimated to be 255,686 gal/day (286 AFY). The total recycled water demand is estimated to be 61,158 gal/day (68.6 AFY). Therefore, the total water demand for existing land uses per the 2020 UWMP would be **316,844 gal/day** or **354 AFY**, compared to a total water demand of the proposed Project (shown in **Table 5**) of **221,070 gal/day** or **248.2 AFY**.

Therefore, implementation of the proposed Project will not obstruct the City’s ability to meet water demands of its customers in normal, single dry, and multiple dry years, because the Project will not use any additional water that was not accounted for in the previous 2020 UWMP.

In addition to evaluating changes in water demand for the Project site in comparison to the 2020 UWMP (**Tables 4 and 5** above), this WSA also evaluates a related aspect of the Project, the change in water demand associated with increasing residential density within the designated SB 330 Replacement Site study area. Per SB 330, in order for the City to approve the Project, the City must also “rezone” an area in the City to offset the loss in residentially zoned land. The City has determined that the Project would displace 479 DU of residential capacity as part of the Project approval. Therefore, the City has identified an additional density of 479 DU within the designated replacement site area. As shown in **Table 6c**, for the SB 330 site, the difference in domestic water usage per day will be a net decrease of **212,787 gal/day**.

**Table 6a – Existing Water Demand of the SB 330 Site**

Land Use	Acres	Domestic Water Demand Rate (gpd/ac)	Total Domestic Water Usage (gal/day)	Recycled Water Demand Rate (gpd/ac)	Total Recycled Water Usage (gal/day)
Low-Medium Density Residential	56.34	3,960	223,106	625	35,212
<b>Total</b>	<b>56.34</b>	-	<b>223,106</b>	-	<b>35,212</b>

**Table 6b – Water Demand Estimate of the Proposed Development of the SB 330 Site**

Land Use	Units	Domestic Water Demand Rate (gpd/unit)	Total Domestic Water Usage (gal/day)	Recycled Water Demand Rate (gpd/unit)	Total Recycled Water Usage (gal/day)
Medium Density Residential	479	268	128,372	27	12,933
<b>Total</b>	<b>479</b>	<b>-</b>	<b>128,372</b>	<b>-</b>	<b>12,933</b>

**Table 6c – Water Demand Summary**

Land Use	Total Domestic Water Usage (gal/day)	Total Recycled Water Usage (gal/day)	Total Water Usage (gal/day)
<b>Existing Land Uses</b>			
Project Site	255,686	61,158	316,844
SB 330 Site	223,106	35,212	258,318
<b>Subtotal</b>	<b>478,792</b>	<b>96,370</b>	<b>575,162</b>
<b>Proposed Project</b>			
Project Site	105,015	116,055	221,070
SB 330 Site	128,372	12,933	141,305
<b>Subtotal</b>	<b>233,387</b>	<b>128,988</b>	<b>362,375</b>
<b>Net Difference</b>			
(gal/day)	<b>-245,405</b>	<b>32,618</b>	<b>-212,787</b>
(%)	<b>48.7%</b>	<b>133.8%</b>	<b>63.0%</b>

As shown in **Table 6b** and **Table 6c** above, the implementation of the Project, and the rezoning of lower-density land for the SB 330 site for the Project, will result in a net decrease in water demand, compared to the 2020 UWMP. Therefore, implementation of the Project would result in a net decrease in water demand. However, after implementation and build-out of the SB 330 Site, there is anticipated to be a net increase of water demand. As a result of no development being proposed for the SB 330 site at this time, no detrimental impact to the City’s water supply is currently expected.

## Water Supply Analysis

This section identifies the sources of water used by the City and evaluates the water supplies that could be used by the City and the proposed Project during normal, single-dry, and multiple-dry years through the year 2045.

Water sources used by the City include groundwater from Chino Groundwater Basin (Chino Basin), treated groundwater from the Chino Basin Desalter Authority (CDA), recycled water from Inland Empire Utilities Agency (IEUA), imported water from the Water Facilities Authority (WFA), and purchased water from the San Antonio Water Company (SAWCo).

The City has already inactivated several wells (Well 3, 4, 9, 15, 31, 35, and 50) due to detection above the maximum contaminant levels. Well 34 was removed from service due to water quality issues. The operations of Wells 44 and 52 are limited due to the migration of the bacterial groundwater plume when these wells are used too frequently. Well 25 was taken out of service due to a Perfluorooctanoic acid (PFOA) detection, which was below the PFOA interim notification level. The impact on supply due to the

closure of these wells is minimized by constructing replacement wells at other locations where contaminant levels are low and constructing wellhead treatment facilities.

Groundwater from the Chino Basin is used by the City either directly by pumping into its distribution system or by treating the groundwater (Wells 41, 44 and 52) at one of its two plants and then pumping the treated groundwater into the City's distribution system. The ultimate capacity of the City's existing and future wells is projected to be 105.8 million gallons per day (mgd) or 132,219 AFY.<sup>6</sup> Additional information on the City's groundwater resources and groundwater rights is provided in Section 2.5.

In addition to its well production, the City also purchases treated Chino Basin groundwater from the CDA. The CDA was formed in 2002 as a Joint Powers Authority consisting of Inland Empire Utilities Agency; Jurupa Community Services District; Cities of Chino, Chino Hills, Norco and Ontario, and Santa Ana River Water Company. Western Municipal Water District joined in 2010. The CDA currently owns and operates two desalters (Chino I and Chino II Desalters) that consist of groundwater extraction wells connected to pumps and pipelines that direct water to advanced treatment facilities. The final product is a high-quality drinking water, which is sold to member agencies through "take or pay" contracts. The Chino I Desalter is located in the City of Chino and commenced operation in 2001 and was expanded in 2005 to have a total capacity of 14.2 MGD. The Chino II Desalter is located in Jurupa Valley and began operation in 2006 and was expanded in 2011 and again in 2017 to have a total capacity of 33 MGD.

Recycled water is provided to the City by IEUA, which owns and operate four regional water recycling plants that produce disinfected and filtered tertiary treated recycled water in compliance with California Title 22 regulations. IEUA provides recycled water to Ontario and other local agencies through a distribution system consisting of pipelines, booster pump stations, pressure regulating station, and reservoirs.<sup>7</sup>

The City has been obtaining recycled water from IEUA since 1972. Currently, recycled water is used in the City for agricultural irrigation, landscape irrigation, golf course irrigation, and industrial uses. Based on the City's current Recycled Water Master Plan and the 2020 UWMP, the City has enough recycled water rights to meet future recycled water demands. Over the past five years, the City recycled water demands have ranged from 7,510 AFY to 9,653 AFY, with an average of 8,167 AFY. The City's actual use of recycled water in AFY 2019-20 was 7,812 acre-feet and the 2015 UWMP projected a recycled water use of 7,929 AFY for 2019-20.

The City also obtains treated imported water from the WFA, which is a wholesale water supplier to the cities of Chino, Chino Hills, Ontario, Upland, and the Monte Vista Water District.<sup>8</sup> The WFA purchases imported water from IEUA, which in turn purchases untreated water from the Metropolitan Water District (MWD). The MWD obtains its water from the State Water Project (SWP) and has projected 100% water supply reliability over the next 20 years, as per its 2020 UWMP.<sup>9</sup> The WFA obtains the raw water from a connection to MWD's Rialto Feeder Pipeline, which starts at MWD's Silverwood Lake Reservoir in the San Bernardino Mountains. Over the past five years, the City has purchased 2,327 AFY to 6,513 AFY, with an average of 4,109 AFY from WFA.

SAWCo leases groundwater rights to the Cities of Fontana, Ontario, Chino and Upland, and the Cucamonga Valley Water District, the Monte Vista Water District, the Jurupa Community Services Water District and Three Valleys Municipal Water District.<sup>10</sup> SAWCo's water supply sources include surface water obtained

from the San Antonio Canyon, water from the San Antonio Tunnel, and groundwater sources from the Chino Basin, Six Basins, and Cucamonga Basin. The majority of SAWCo’s water supplies are obtained from groundwater produced from the Cucamonga Basin and surface water from San Antonio Creek. Over the past five years, the City has purchased 171 AFY to 565 AFY, with an average of 364 AFY from SAWCo. Actual water supplies provided to the City for the year 2020 are summarized in **Table 7**.

**Table 7 – Water Supply Sources for the City of Ontario in 2020**

<b>Water Supplier</b>	<b>Water Source</b>	<b>Amount (AFY)</b>
City of Ontario	Groundwater	18,395

Water Facilities Authority (WFA)	Purchased/Imported Water	6,513
San Antonio Water Company (SAWCo)	Purchased/Imported Water	565
Inland Empire Utilities Authority (IEUA)	Recycled Water	7,812
<b>Total</b>		<b>39,921</b>

Source: City of Ontario, Table 6-8 Water Supplies – Actual, 2020 UWMP

It is required that every urban water supplier assess the reliability to provide water service to its customers under normal, dry, and multiple dry water years. The City depends on a combination of imported and local supplies to meet its water demands and has taken numerous steps to ensure that it has adequate supplies. Water supplies available to the City are projected to meet full-service demands. The UWMP states that the City will be able to meet demand with projected supplies between 2025 and 2040 during normal years, single dry years, and multiple dry years (see **Table 8**).<sup>11</sup>

*Units of measure (AF, CCF, MG) must remain consistent throughout the UWMP as reported in Table 2-3 of the 2020 UWMP. Note: Supply and demand are equal for years 2040 and 2045 because the City anticipates buildout to occur in 2040.						
Source: City of Ontario 2020 UWMP, 2021						

The City will increase its total water supply from 39,921 AF from 2020 to 73,668 AF in 2045. The increased water supply will come from full utilization of the City’s groundwater rights in the Chino Basin allowed under the Judgment (including increased groundwater recharge of stormwater and recycled water), and continued expansion of recycled water use and expansion of desalter water. The increase in imported water is assumed to be available in wet and normal years. With the ability for the City to store water in the Chino Basin, in its local and supplemental storage accounts as well as the DYY Program storage account, the City has the capability and water supply available to reduce imported water deliveries in dry years and increase groundwater production to meet future demands.<sup>12</sup>

<sup>12</sup> City of Ontario, 2021. 2020 Urban Water Management Plan. Prepared by Ontario Municipal Utilities Company.

## Groundwater Analysis

Since most of the potable water supplied by the City comes from groundwater, SB610 requires a groundwater analysis to be included as part of the WSA. The Water Code requires that the WSA include:

- Groundwater information from the 2020 UWMP
- Groundwater basin description: Including the legal rights to pump
- Historic Use of Groundwater: from the 2020 UWMP
- Projected Use of Groundwater
- Sufficiency of Groundwater from Chino Basin: The City's legal right to pump water in an amount necessary to meet all of its demands has been adjudicated and will ensure the long-term reliability of the groundwater source as the safe yield of the aquifer has been determined. The construction of Wells 45, 46, and 47, as part of the DYY Storage Program, increases the City's groundwater pumping capacity to meet peak demands. The City also has stored water in the Chino Basin and participates in an ongoing groundwater recharge program, using stormwater, dry-weather runoff, and recycled water, that ensures the safe yield of the Chino Basin is not exceeded. The ongoing expansion of the groundwater desalter program and recycled water program will reduce the City's dependence on groundwater pumping. In addition, the City participates in water conservation efforts through the California Urban Water Conservation Council (CUWCC), adopts ordinances pertaining to water shortage contingency planning, conservation pricing, and various public outreach programs to encourage its customers to reduce their water consumption.

### Groundwater Information from the 2020 UWMP

The 2020 UWMP contains a description of the Chino Groundwater Basin, the City's current and projected water supplies and demands, the reliability of the water supply, water shortage plans, the Optimum Basin Management Plan, and the adjudication judgment administered by the Chino Basin Watermaster. In addition, Appendix E and Appendix K of the UWMP explains the methods and calculations by which the future water demand of the City was estimated, based on the land use designations in the General Plan.

### Groundwater Basin Description

The City obtains its groundwater from the Chino Groundwater Basin. The Chino Basin encompasses about 235 square miles of the upper Santa Ana River watershed and lies within portions of San Bernardino, Riverside, and Los Angeles counties. The surface area of the Chino Basin is approximately 154,000 acres (or 240 square miles). The San Antonio Creek and Cucamonga Creek drain the Chino Basin area southward and flow into the Santa Ana River. Over the past 20 years, total groundwater production from the Chino Basin has ranged from approximately 133,275 AFY to 188,910 AFY. The Chino Basin is divided into five management zones, based on similar hydrologic conditions, as shown in **Figure 4, Chino Groundwater Basin Management Zones**. The City is located approximately in the center of the Chino Basin.

Groundwater quality in Chino Basin is generally good with better quality in the northern portion of the basin where recharge occurs. Salinity (TDS) and nitrate-nitrogen concentrations are higher in the southern portion of the basin. The Chino Basin has been extensively studied by the Chino Basin Watermaster. Reports are available at this website: <http://www.cbwm.org/>.

The Chino Basin Watermaster began development of the Optimum Basin Management Program (OBMP) in 1998 and completed it in 2000. The purpose of the program is to address both water quality and water supply considerations. The southern portion of the Chino Basin requires brackish groundwater treatment to control the outflow of salts and nitrates into the Santa Ana River. As such, one of the main benefits of

the CDA is to remove salts and nitrates to clean up the Chino Basin. CDA operates 28 groundwater extraction wells that prevent brackish groundwater from flowing into the Santa Ana River.

As part of the Chino Basin Watermaster requirements in the OBMP, the CDA can produce up to 40,000 AF from the Chino Basin every year for the purpose of groundwater cleanup and control of contaminant migration. Member agencies have contract entitlements to receive a total of 35,200 AFY of treat water from CDA. The City's current contract entitlement is 8,553 AFY.

### ***Legal Right to Pump from the Chino Basin***

Water rights to the Chino Basin were adjudicated in 1978 by the Superior Court of the State of California for San Bernardino County. Since that time, the Chino Basin has been sustainably managed, as required by the Judgment, under the direction of the court appointed Watermaster. The original Watermaster was the Chino Basin Municipal Water District (now IEUA). Since 1998, the Watermaster has been the Chino Basin Watermaster.

Multiple cities and water purveyors pump groundwater from the Chino Basin for all or part of their municipal and industrial water supplies. Agricultural users also pump groundwater from the Basin. The safe yield of the Chino Basin is 131,000 AFY as of 2021. As of July, 2020 the Safe Yield is allocated at 82,800 AFY to the Overlying Agricultural Pool, 7,366 AFY to the Overlying Non-Agricultural Pool, and 40,834 AFY to the Appropriative Pool. Per the Judgment, the City has appropriative rights to 20.742 percent of the OSY. With an OSY of 40,834 AF, the City's current appropriative right is approximately 8,470 AFY as of July 2020. The City has purchased and has rights to 3,921 AF of Overlying Non-Agricultural Pool water.

The Judgment states that all Chino Basin users can pump a sufficient quantity of water from the Basin to meet their requirements. If pumping by a party exceeds its share of the safe yield, assessments are levied by the Chino Basin Watermaster to replace overproduction. The Judgment also recognizes that there is a substantial amount of available unused groundwater storage capacity in the Chino Basin that can be used for storage and the conjunctive use of supplemental and basin waters. The Chino Basin Watermaster has the authority to reallocate shares of unallocated safe yield water on an annual basis, as per the latest 2019 Watermaster Resolution No. 2019-03.<sup>13</sup> (add source – Watermaster Resolution 2019-03). The Watermaster publishes an annual report that summarizes the status and management of the Chino Basin. A copy of the Chino Basin Judgment and latest Watermaster Annual Report can be found at [www.cbwm.org](http://www.cbwm.org).

The City also participates in the Dry Year Yield Storage Program (DYY Program), which is a cooperative conjunctive use program involving Metropolitan Water District of Southern California (MWD), IEUA, Chino Basin Watermaster, Three Valleys Municipal Water District (TVMWD), and some of the Chino Basin groundwater producers. The DYYP can store up to 100,000 AF with maximum replenishment of 25,000 AFY and maximum extraction of 33,000 AFY. During FY 2019-20, there was 45,961 AF within the DYYP account, resulting in a total managed storage volume of 587,806 AF (541,845 AF + 45,961 AF). The agreement that authorized the DYYP will expire in 2028. The City authorized execution of an agreement with IEUA to participate in the DYY program in 2003. Participation obligates the City to reduce its use of imported water compared to the previous year by a fixed amount, known as the "shift obligation." The City's shift obligation is 8,076 AFY.

During years when MWD calls for extraction, the City's WFA purchases would be reduced by 8,076 AFY compared to the previous year. Since Jurupa Community Services District does not have an imported water connection, it has entered into an agreement with the City for meeting its shift obligation. Under

---

<sup>13</sup> Chino Basin Water Master, 2019. Watermaster Resolution No. 2019-03.

this agreement, Jurupa Community Services District conveys groundwater to the City in an amount equal to its shift obligation. The City can use the DYY facilities to meet its normal water demands during other periods but is responsible for the cost of well operation and maintenance. The program allows the City to be less reliant upon imported water supplies. The additional groundwater capacity allows the City to increase the percentage of groundwater supply used to meet peak demands.

In addition to the appropriative pool and overlying non-agricultural pool water rights, as well as the contract obligations through the DYY Program, the following is a summary of other groundwater rights for Chino Basin:

### ***Land Use Conversions***

The City gains rights to additional Chino Basin groundwater as a result of land use conversions from agricultural to non-agricultural uses. This is expected to increase from development of Ontario Ranch; the total of which is adjusted annually by the Watermaster. As of FY 19/20, the City receives 4,254 AFY from land use conversions.

### ***Annual Early Transfers***

As stated above, the Chino Basin Watermaster reallocates the unused portion of the Chino Basin Safe Yield from the Overlying Agricultural Pool to the Appropriative Pool members as a supplement to the Appropriative Pool share of Operating Safe Yield rights in any year. These transfers are permanent if agricultural land has been converted to non-agricultural use, or temporary if agricultural pool extractions are less than their share of the Safe Yield. From FY 2000-01 to FY 2019-20, the annual quantity of the Agricultural Pool's share available for reallocation to Appropriative Pool members ranged from 40,822 AF to 61,014 AF, with an annual average of approximately 50,457 AF. As Agricultural Pool production declines within the Chino Basin, the reallocation of water to the Appropriative Pool will increase.

### ***Increased Groundwater Recharge***

The City is entitled to water rights due to increased groundwater recharge with stormwater and recycled in the Chino Basin. The credited amount is based on the volume recharged and therefore varies annually but is projected to increase over time. Stormwater recharge credit is assigned based on OSY percentage. Recycled water recharge credit is assigned based on wastewater contribution percentage. In FY 2018/2019, 2,544 AF of recycled water was recharged for the City. In FY 19/20, no recharge credits were purchased by the City due to limitations on groundwater storage capacity.

### ***Fontana Recycled Water Rights***

The City has a long-term contract to purchase up to 3,000 AFY of recharged recycled water rights from the City of Fontana. The City of Fontana does not operate a water system. The amount purchased by OMUC each year will vary. In FY 2018/2019, the City purchased 2,157 AF of Fontana's recycled water entitlement. In FY 19/20, no recharged water rights were purchased due to limitations on groundwater storage capacity.

### ***City Groundwater Storage***

The City has rights to store water in the Chino Basin (Appropriative and Overlying Non-Agricultural) and has been increasing its various storage accounts in recent years. The City holds water in both local storage accounts and supplemental accounts. Local storage accounts hold unpumped OSY groundwater rights and stormwater that has been recharged into the Chino Basin. Supplemental accounts hold both imported water and recycled water that has been recharged into the Chino Basin. As of June 30, 2020, the City has

96,544 AF in storage pursuant to Appropriative rights and 3,461 AF in storage pursuant to Overlying Non-Agricultural rights. The various groundwater rights held by the City are summarized in **Table 9**.

**Table 9 – City of Ontario Groundwater Rights Summary**

	<b>Current (AFY)</b>	<b>Future Groundwater Produced (AFY)</b>
Dry Year Storage Program	8,076	8,076
Appropriative Pool	8,470	8,470
Overlying Non-Agricultural Pool	3,920	At least 3,920
Land Use Conversions	4,254	16,602
Annual Early Transfer	5,177	20.742 % of Ag Early Transfer
Groundwater Recharge Credits	Unknown	9,600 (in 2035)
Fontana Recycled Water Rights	Max. 3,000	At least 3,000
SAWC Groundwater	600	At least 600
Groundwater Storage Accounts	Excess Carry Over Account: 39,261 Supplemental Account: 57,283	33,500 to 40,500 38,700 to 60,700

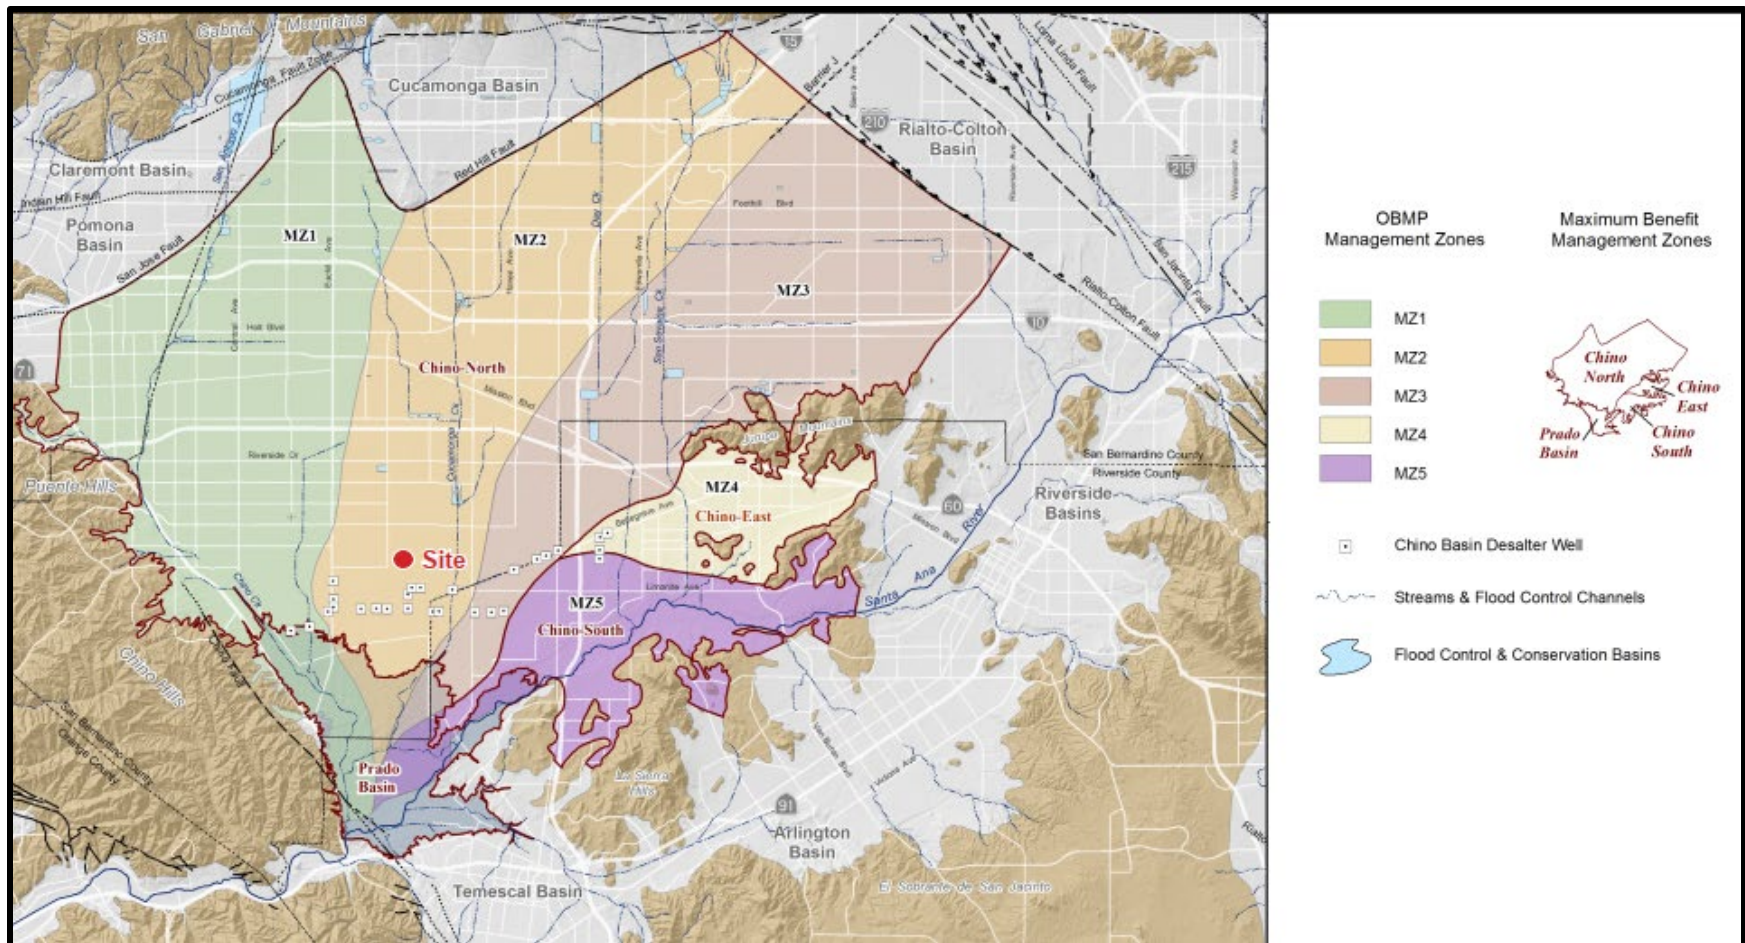

Figure 4 – Chino Groundwater Basin Management Zone

## Historic Use of Groundwater

As stated above, the City primarily obtains its water supplies from groundwater wells located in the Chino basin. The proposed Project will receive water from the City, using groundwater extracted from the Chino Basin, treated groundwater from the CDA, recycled water from the IEUA, and imported water from the WFA. The amount of groundwater pumped by the City from the Chino Basin since 2010 is listed below in Table 10. A map of the location of the groundwater wells and pressure zones is shown on **Figure 5, Ontario Ultimate Water System**.

**Table 10 – Historic Groundwater Production**

Calendar Year	Groundwater produced (AF)
2010-11	18,938
2011-12	19,164
2012-13	20,801
2013-14	21,724
2014-15	17,425
2015-16	22,751
2016-17	24,672
2017-18	26,109
2018-19	19,604
2019-20	18,395

## Projected Use of Groundwater

Groundwater from the Chino Basin will be directly pumped by the City into its distribution system or by treating the groundwater extracted at Wells 41, 44 and 52 through ion-exchange facilities before pumping it into the distribution system. The City's current well capacity is 39,638 gallons per minute (gpm). When the nine future wells come online, the capacity of the City's groundwater system will be greater than 72,315 gpm, this includes the nine future wells.

## Sufficiency of Groundwater from Chino Basin

According to the 2020 UWMP, the City's water supply (including conservation measures) will be sufficient to supply all of its needs to residential, commercial, and industrial customers through the year 2045 during normal, single dry, and multiple dry years. The City's legal right to pump water in an amount necessary to meet all of its demands has been adjudicated and will ensure the long-term reliability of the groundwater source as the safe yield of the aquifer has been determined.

Approximately two-thirds of the City's water supply is groundwater pumped through its own wells located in the Chino Basin. The construction of Wells 45, 46, and 47, as part of the DYY Storage Program, increases the City's groundwater pumping capacity to meet peak demands. The City also has 96,544 AF of stored water in the Chino Basin as of 2020 and participates in an ongoing groundwater recharge program, using stormwater, dry-weather runoff, and recycled water, that ensures the safe yield of the Chino Basin is not exceeded. The ongoing expansion of the groundwater desalter program and recycled water program will reduce the City's dependence on groundwater pumping. In addition, the City participates in water conservation efforts through the CUWCC, adopts ordinances pertaining to water shortage contingency

planning, conservation pricing, and various public outreach programs to encourage its customers to reduce their water consumption.

The Cities of Chino, Chino Hills, Ontario, Upland, and the Monte Vista Water District submitted the Water Supply Reliability Certification and supporting documentation to the State Water Resources Control Board in June 2016. This was submitted under the requirements of the State Water Resources Control Board's (SWRCB's) May 18, 2016 Emergency Regulation. The results are summarized in Tables 10 and 11.

**Table 11 – Water Supplies Available to the City of Ontario for Water Years 2017-2019**

	WY 2017 (AF)	WY 2018 (AF)	WY 2019 (AF)
Water Facilities Authority	13,044	13,448	11,840
Chino Desalter Authority	8,533	8,533	8,533
San Antonio Water Company	545	545	545
Groundwater Rights (Appropriative Pool)	30,137	17,726	17,726
Groundwater Rights (Non-Agricultural Pool)	4,656	2,328	2,328
Recycled Groundwater Recharge	2,684	2,792	2,357

 AF = Acre Feet

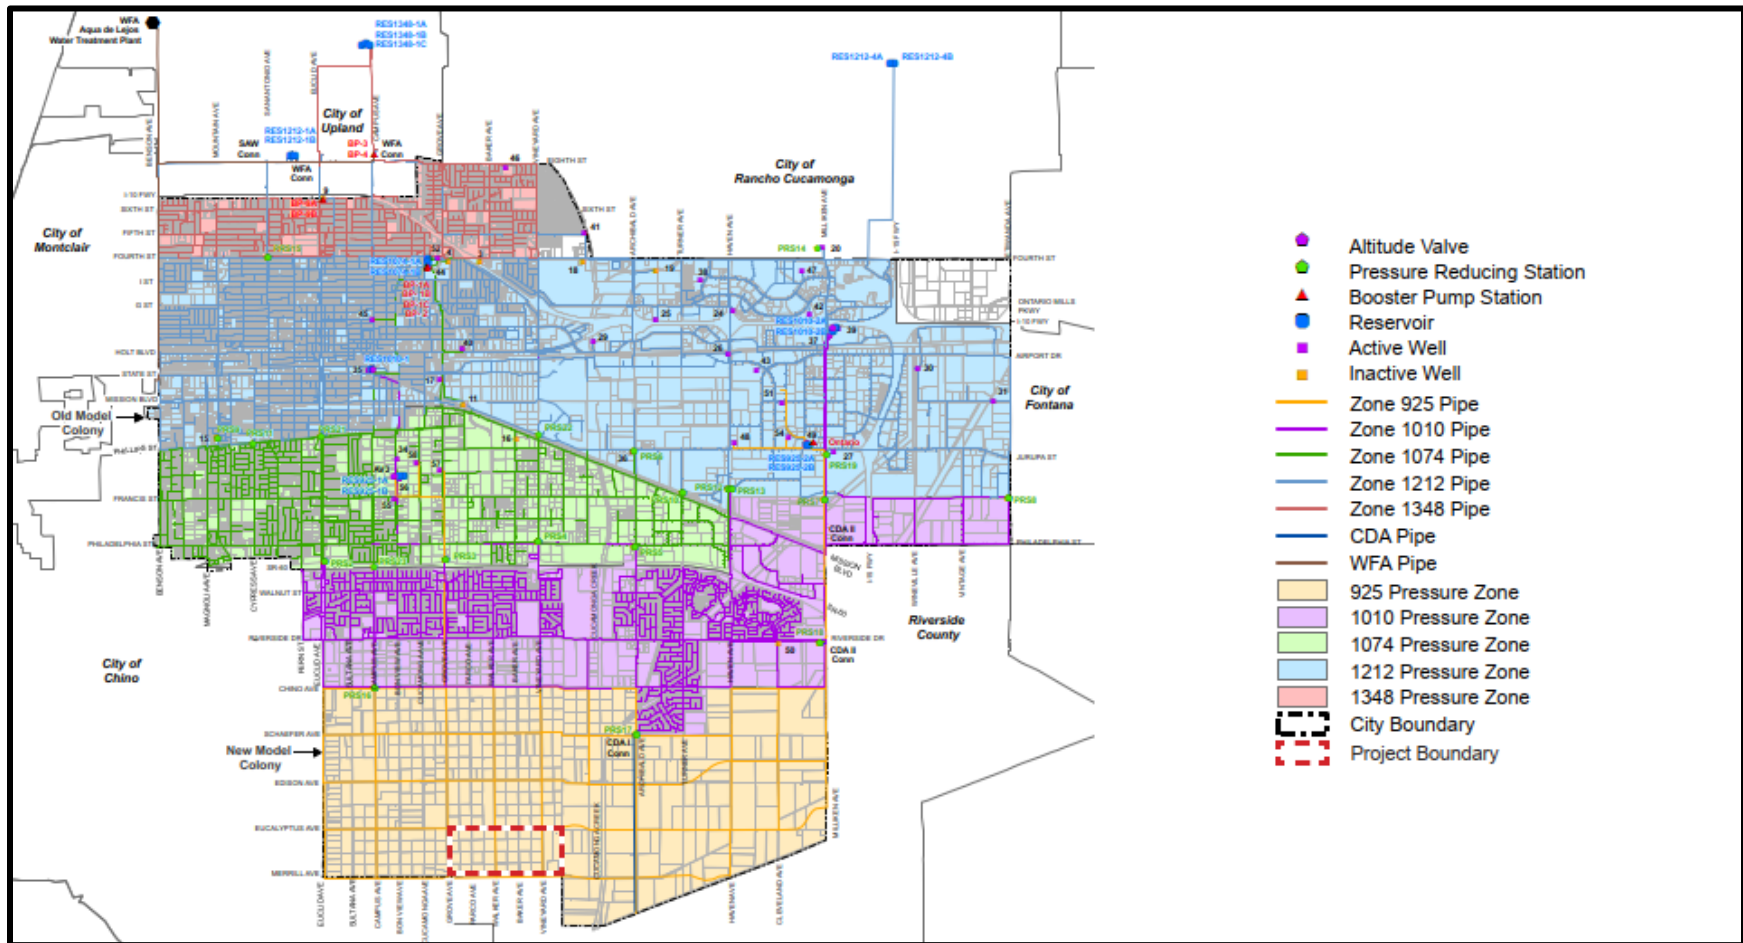

Figure 5 – Ontario Ultimate Water System

In summary, there are sufficient groundwater supplies available to the City, based on the analysis provided above as well as the programs overseen by the Chino Basin Watermaster. The ongoing efforts by the City to implement water conservation programs and the use of recycled water will further reduce its reliance on groundwater resources.

## Water Shortage Contingency Planning

The 2015 Water Shortage Contingency Plan was updated in as part of the 2020 UWMP, in response to the Emergency Conservation Regulations mandated by the State Water Resources Control Board. Under this ordinance, the Water Conservation Plan was updated with more stringent prohibitions and penalties. The Water Shortage Contingency Plan is a detailed approach which presents how the City intends to act, or respond, in the case of an actual water shortage contingency.

In its 2015 Plan, the City's WSCP was designed to provide a minimum of 50 percent of normal supply during a severe or extended water shortage. For its 2020 Plan, the City's WSCP is designed to provide water supplies in the event there is less than 50 percent of normal supply during a severe or extended water shortage. Water shortage trigger mechanisms have been established to ensure that this policy is implemented. This includes six structured stages of action referred to as water supply shortage planning levels. Stage 1 addresses a water supply shortage of up to 10 percent; Stage 2 addresses a water supply shortage of up to 20 percent; Stage 3 addresses a water supply shortage of anywhere between 20 percent to 50 percent; and Stage 4 addresses a water supply shortage of more than 50 percent. For its 2020 Plan, the City has prepared a draft Water Conservation Plan (see Appendix N of the 2020 UWMP) that will address the six standard stages of action in accordance with DWR. Under this draft Water Conservation Plan, the City will continue to incorporate Ordinance No. 3027's voluntary stage during normal water supply conditions as well as the existing Stage 1 and Stage 2 water supply shortage levels as is. However, the City has amended Stage 3 to address a water supply shortage of up to 30 percent. In addition, the City has included a Stage 4 and Stage 5 that will be used to address a water supply shortage of up to 40 percent, and 50 percent, respectively. The City's existing Stage 4 has been amended to a Stage 6 level which addresses a water supply shortage of more than 50 percent.

## Water Efficiency Strategies

The City does not plan to add a new source of water supply to address customer demands, but instead will consider increased supplies from existing sources. Beginning July 1, 2022, the City will prepare and submit an Annual Assessment which will include a review of water supplies available to meet water demands for the current and upcoming years. In the event the City is currently in, or considers entering into, one of the standard water shortage levels identified above, the City will consider some of the following water supply augmentation and operational actions (refer to Sections 8.4.2 and 8.4.3 of the 2020 UWMP for more information):

- Improved monitoring, analysis, and tracking of customer water usage to enforce demand reduction measures
- Optimized production from existing available water supply sources
- Potential use of emergency supply sources, including emergency interconnections
- Potential blending of water supply resources
- Improved monitoring, maintenance, and repairs to reduce water distribution system losses

## Summary

A Water Supply Assessment (WSA) was prepared to assess the water demand and supply conditions with implementation of the proposed Project. The Project proposes to revise current General Plan land use designations from Business Park and Low Medium Density Residential (as shown in Table 5) to Industrial and Business Park. In addition, the Project requires upzoning land within the Grove Corridor SB330 Replacement Site to offset the “loss” of 479 DU of residential zoning within the Project area. As shown in **Table 5**, is estimated to be 105,015 gal/day (116.8 AFY). The total recycled water usage is estimated to be 116,055 gal/day (131.4 AFY). Therefore, the total water demand would be **221,070 gal/day** or **248.2 AFY**. The Project (including upzoning within the SB 330 Replacement Site area) would result in a decrease in domestic water demand, an increase in recycled water demand, and an overall decrease in total water demand of 1.4% or 95,774 gallons/day. This increase in recycled water demand will not affect the City’s ability to supply recycled water to the Project or to the City.

According to the City’s UWMP, the City has adequate supplies to serve 100 percent of its customers during normal, dry year, and multiple dry year demand through 2045 accounting for projected population increases and corresponding increases in water demand. This WSA concludes that the City will have sufficient water supplies available during normal, single dry, and multiple dry years through the year 2045 to meet all projected water demands associated with its existing and future customers, including the proposed project. In the unlikely event of a water shortage, implementation of the City’s Water Conservation Plan and water efficiency strategies would ensure that sufficient water supplies were available to serve its customers, including the project and existing and future users.

**Projected Future Land Use in 2020 UWMP**

APN	Acres	Land Use
1054 041-01	9.00	Low-Medium Density Residential
1054 041-02	9.14	Low-Medium Density Residential
1054-061-01	9.60	Low-Medium Density Residential
1054-061-02	9.50	Low-Medium Density Residential
1054-251-01	9.60	Low-Medium Density Residential
1054-251-02	9.50	Low-Medium Density Residential
1054-301-01	9.10	Business Park
1054-301-02	9.00	Business Park
