RM	Recommended Measures
SCAQMD	South Coast Air Quality Management District
SRA	Source Receptor Area
TAC	Toxic Air Contaminant
URF	Unit Risk Factor
UTM	Universal Transverse Mercator
VMT	Vehicle Miles Traveled

EXECUTIVE SUMMARY

This report evaluated the potential mobile source health risk impacts to sensitive receptors (residents and schools) and adjacent workers associated with the development of the proposed Project, more specifically, health risk impacts as a result of exposure to diesel particulate matter (DPM) as a result of heavy-duty diesel trucks accessing the site. This section summarizes the findings of this report.

The results of the health risk assessment of lifetime cancer risk from Project-generated DPM emissions are provided in Table ES-1 and Table ES-2 below for the Project under the Planning Area 1 Option A and Planning Area 1 Option B scenarios.

PLANNING AREA 1 OPTION A

Residential Exposure Scenario:

The residential land use with the greatest potential exposure to Project DPM source emissions is located west of N Vineyard Avenue and north of the I-10 freeway just adjacent to the Project site. At the maximally exposed individual receptor (MEIR), the maximum incremental cancer risk attributable to Project DPM source emissions is estimated at 8.22 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0052, which would not exceed the applicable threshold of 1.0.

Worker Exposure Scenario:

The worker receptor land use with the greatest potential exposure to Project DPM source emissions is located on-site in the proposed western portion of PA 2 (Urban Commercial land use). At the maximally exposed worker (MEIW), the maximum incremental cancer risk impact at this location is 1.47 in one million which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0047, which would not exceed the applicable threshold of 1.0.

School Child Exposure Scenario:

The school site land use with the greatest potential exposure to Project DPM source emissions is located at the Mariposa Elementary School located approximately 0.50 miles (805 meters) southwest of the Project site. At the maximally exposed individual school child (MEISC), the maximum incremental cancer risk impact at this location is 0.11 in one million which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0056, which would not exceed the applicable threshold of 1.0.

Cumulative Exposure:

The results of the analysis also indicate that the project will not result in a significant cumulative health risk. Section 2.7 contains a detailed cumulative analysis for the Project.

PLANNING AREA 1 OPTION B

Residential Exposure Scenario:

The residential land use with the greatest potential exposure to Project DPM source emissions is located west of N Vineyard Avenue and north of the I-10 freeway just adjacent to the Project site. At the maximally exposed individual receptor (MEIR), the maximum incremental cancer risk attributable to Project DPM source emissions is estimated at 9.44 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0059, which would not exceed the applicable threshold of 1.0.

Worker Exposure Scenario:

The worker receptor land use with the greatest potential exposure to Project DPM source emissions is located on-site in the proposed western portion of PA 2 (Urban Commercial land use). At the maximally exposed worker (MEIW), the maximum incremental cancer risk impact at this location is 1.68 in one million which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0053, which would not exceed the applicable threshold of 1.0.

School Child Exposure Scenario:

The school site land use with the greatest potential exposure to Project DPM source emissions is located at the Bernt Elementary School located in the northern portion of the site, south of 4th Street. At the maximally exposed individual school child (MEISC), the maximum incremental cancer risk impact at this location is 0.625 in one million which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0031, which would not exceed the applicable threshold of 1.0.

Cumulative Exposure:

The results of the analysis also indicate that the project will not result in a significant cumulative health risk. Section 2.7 contains a detailed cumulative analysis for the Project.

TABLE ES-1: SUMMARY OF PLANNING AREA 1 OPTION A CANCER RISKS

Time Period	Location	Maximum Lifetime Cancer Risk (Risk per Million)	Significance Threshold (Risk per Million)	Exceeds Significance Threshold
70 Year Exposure (2015 to 2084)	Maximum Exposed Sensitive Receptor	8.22	10	NO
40 Year Exposure (2015 to 2054)	Maximum Exposed Worker Receptor	1.47	10	NO
9 Year Exposure (2015 to 2023)	Maximum Exposed School Child	0.11	10	NO

TABLE ES-2: SUMMARY OF PLANNING AREA 1 OPTION B CANCER RISKS

Time Period	Location	Maximum Lifetime Cancer Risk (Risk per Million)	Significance Threshold (Risk per Million)	Exceeds Significance Threshold
70 Year Exposure (2015 to 2084)	Maximum Exposed Sensitive Receptor	9.44	10	NO
40 Year Exposure (2015 to 2054)	Maximum Exposed Worker Receptor	1.68	10	NO
9 Year Exposure (2015 to 2023)	Maximum Exposed School Child	0.625	10	NO

1 INTRODUCTION

The purpose of this Health Risk Assessment (HRA) is to evaluate Project-related impacts to sensitive receptors (residential, schools) and adjacent workers as a result of heavy-duty diesel trucks accessing the site.

The South Coast Air Quality Management District (SCAQMD) typically issues a comment letter on the Notice of Preparation of a CEQA Document. Per the SCAQMD's typical comment letter, if a proposed Project is expected to generate/attract diesel trucks, which emit diesel particulate matter (DPM), preparation of a HRA is necessary. This document serves to meet the SCAQMD's request for preparation of a HRA. The mobile source HRA has been prepared in accordance with the document Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis (1). Cancer risk is expressed in terms of expected incremental incidence per million population. The SCAQMD has established an incidence rate of ten (10) persons per million as the maximum acceptable incremental cancer risk due to DPM exposure. This threshold serves to determine whether or not a given project has a potentially significant development-specific and cumulative impact.

The AQMD has published a report on how to address cumulative impacts from air pollution: *White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution* (2). In this report the AQMD clearly states (Page D-3):

"...the AQMD uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or EIR. The only case where the significance thresholds for project specific and cumulative impacts differ is the Hazard Index (HI) significance threshold for toxic air contaminant (TAC) emissions. The project specific (project increment) significance threshold is $HI > 1.0$ while the cumulative (facility-wide) is $HI > 3.0$. It should be noted that the HI is only one of three TAC emission significance thresholds considered (when applicable) in a CEQA analysis. The other two are the maximum individual cancer risk (MICR) and the cancer burden, both of which use the same significance thresholds (MICR of 10 in 1 million and cancer burden of 0.5) for project specific and cumulative impacts.

Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant."

The SCAQMD has also established non-carcinogenic risk parameters for use in HRAs. Non-carcinogenic risks are quantified by calculating a "hazard index," expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). An REL is a concentration at or below which health effects are not likely to occur. A hazard index less of than one (1.0) means that adverse health effects are not expected. Within this analysis, non-carcinogenic exposures of less than 1.0 are considered less-than-significant.

1.1 SITE LOCATION

The proposed Meredith International Centre Specific Plan Amendment development is located north of the Interstate 10 (I-10) Freeway and east of Vineyard Avenue in the City of Ontario as shown on Exhibit 1-A. Existing land uses within the Project site include a commercial plaza in the eastern portion of the site, west of Archibald Avenue, and the Bernt Elementary School in the northern portion of the site, south of 4th Street.

EXHIBIT 1-A: LOCATION MAP

1.2 STUDY AREA

The Project study area includes single-family and multi-family residential uses located to the west of the Project site, across Vineyard Avenue, as well as neighborhood commercial uses and a construction equipment rental center. Land uses north of the Project site, across 4th Street, include a mix of residential, commercial, and industrial developments. San Bernardino County Flood Control basins are located north/northeast of the site. Commercial uses and the Cucamonga-Guasti Regional Park are located to the east of the Project site, across Archibald Avenue. The I-10 freeway is directly south of the Project site, and the Los Angeles/Ontario International Airport (ONT) is located approximately three-quarter miles south of the Project site. Existing surrounding land uses are graphically presented on Exhibit 1-B.

1.3 PROJECT DESCRIPTION

The Meredith International Centre Specific Plan Amendment (Meredith SPA, Specific Plan Amendment, SPA) proposes a mix of industrial, commercial, and residential land uses within five planning areas. The Planning Areas (PA) and associated land uses are discussed below, and presented graphically in Exhibit 1-C.

Planning Area 1 (PA 1) encompasses approximately 146.6 acres in the northwesterly corner of the Project site and is the largest of the Planning Areas. Uses allowed within this Planning Area would include general light industrial and warehouse/distribution operations. The Specific Plan Amendment allows two build-out scenarios within Planning Area 1: Option A assumes removal/demolition of the Bernt School, and development of the former school site as an industrial land use within the Specific Plan Area. Option B assumes continued operations of the Bernt School in its present location, in which case, screening of the School site and buffering of effects of adjacent industrial land uses would be accomplished as reflected in the Meredith SPA. The Option A and Option B site plans for PA 1 are shown on Exhibits 1-D and 1-E, respectively. For the purposes of this analysis, it is assumed that Planning Area 1 will be constructed and occupied by 2017.

At the time this air quality analysis was prepared, the future specific industrial tenants of Planning Area 1 were unknown. For the purposes of this analysis, Planning Area 1 tenants are assumed to include permitted, conditionally permitted, and ancillary uses described under the SPA's Industrial land use designation, and listed at SPA Table 5-1, *Permitted, Conditional, and Ancillary Uses*.

Planning Area 2 (PA 2) encompasses approximately 43.7 area located in the southwestern portion of the Specific Plan Area. Planning Area 2 is bordered on the north by Inland Empire Boulevard, on the south by the I-10 Freeway, on the west by North Vineyard Avenue, and on the east by the Cucamonga Creek Channel. The Urban Commercial designation of Planning Area 2 allows for a range of commercial uses that benefit from the property's adjacency to the I-10 Freeway and the ONT Airport. Permitted, conditionally permitted, and ancillary uses within the Urban Commercial designation are listed at SPA 5-1, *Permitted, Conditional, and Ancillary Uses*. Planning Area 2 is designed as a highly active area offering a variety of market-driven commercial uses such as retail and fast food restaurants. Up to 200 overnight lodging rooms

also are permitted in Planning Area 2, with the intention of serving the surrounding community and region, such as visitors to the nearby Ontario Convention Center and the ONT Airport. For the purposes of this analysis, it is assumed that PA 2 would be constructed and occupied by 2020.

Planning Area 3 (PA 3) comprises approximately 25.3 acres located in the southeastern portion of the Specific Plan Area. As shown in Exhibit 1-C, Planning Area 3 is bordered on the north by Inland Empire Boulevard, on the south by the I-10 Freeway, on the west by the Deer Creek Channel, and on the east by Archibald Avenue. Similar to Planning Area 2, the Urban Commercial designation of Planning Area 3 allows for a range of commercial uses that benefit from proximity to transportation corridors. Located closer to the SPA's proposed Urban Residential area (within Planning Area 4), and to the potential alignment of the Gold Line transit corridor, Planning Area 3 is envisioned to offer smaller, pedestrian-oriented retail uses. Up to 400 overnight lodging rooms are also permitted in Planning Area 3. Similar to PA 2, specific tenants were unknown at the time of this analysis. For the purposes of this analysis, it is assumed that PA 3 would be constructed and occupied by 2020.

Planning Area 4 (PA 4) comprises approximately 21.4 acres located in the southeastern portion of the Specific Plan area, and would contain Urban Residential uses. As shown in Exhibit 1-B, this area is bordered on the north by San Bernardino County Flood Control District (SBFCD) facilities, on the south by Inland Empire Boulevard, on the west by the Deer Creek Channel, and on the east by Planning Area 5. The Urban Residential designation of Planning Area 4 allows for high-density and medium-high density residential land uses (for-sale or for-rent multi-family residential units). Urban Residential uses implemented under the SPA would be within walking distance to a variety of shopping and employment opportunities, Cucamonga-Guasti Regional Park, and the potential Gold Line transit corridor. For the purposes of this analysis, it is assumed that Planning Area 4 would be constructed and occupied by 2020.

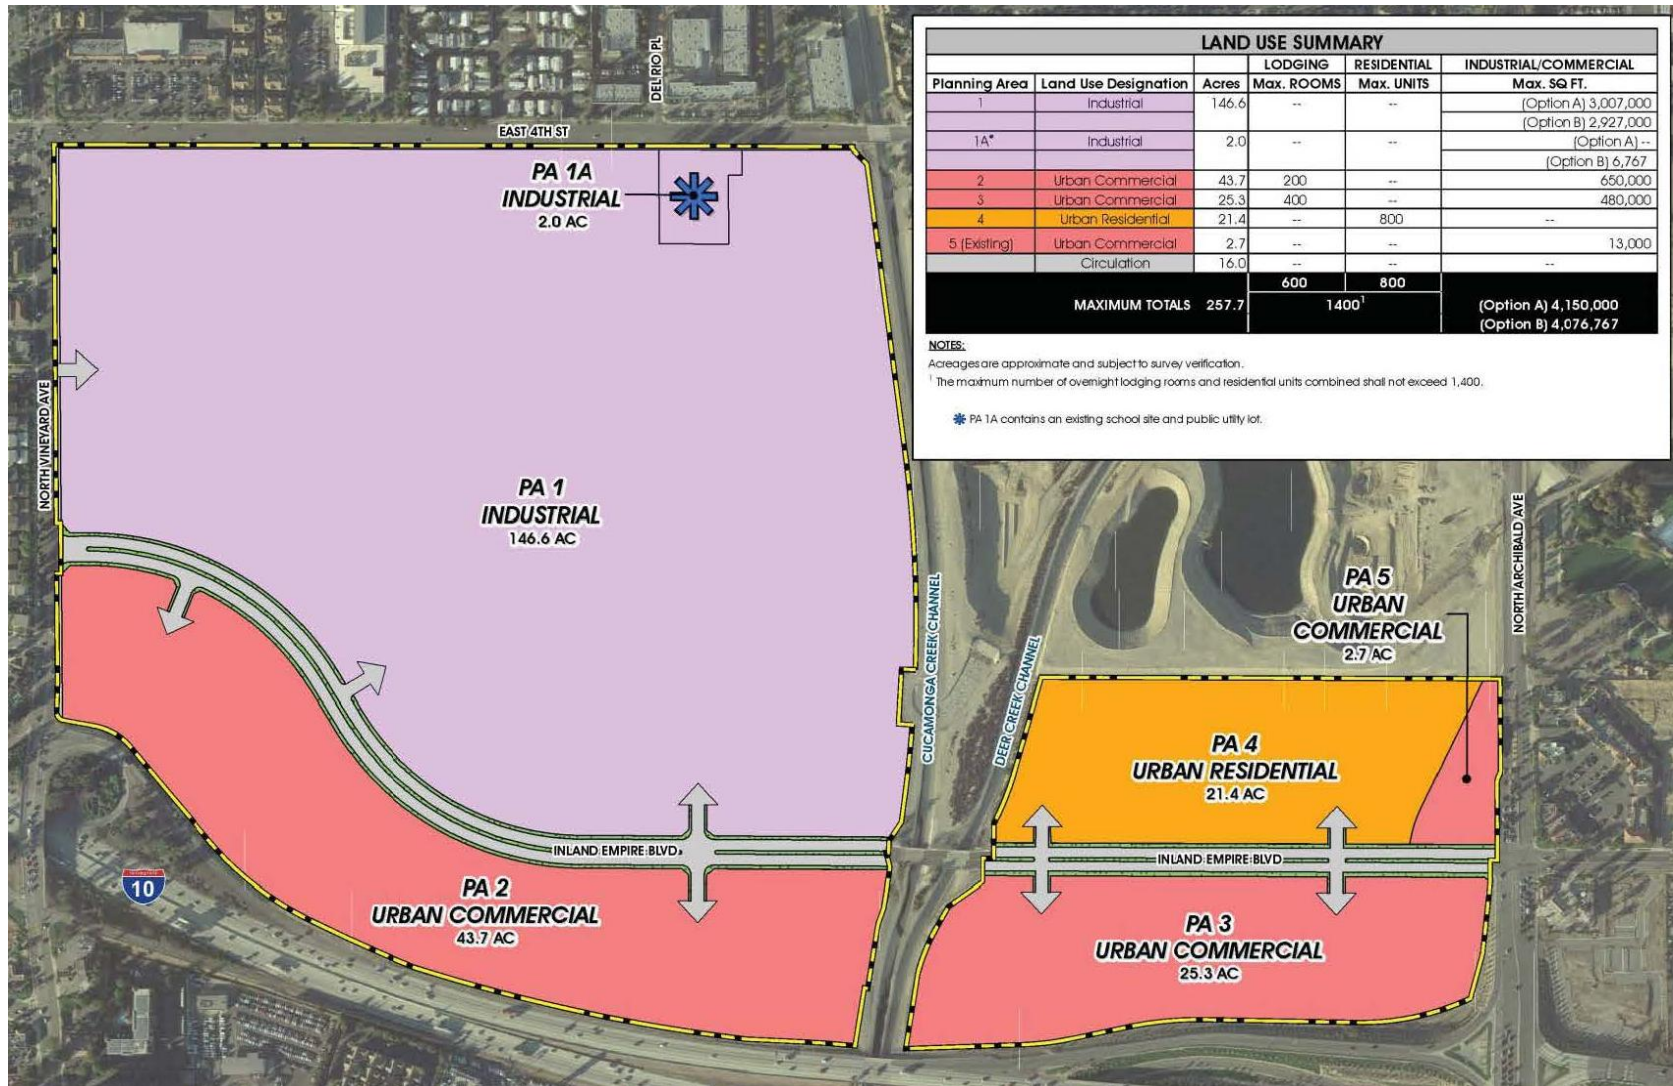

Planning Area 5 (PA 5) encompasses 2.7 acres and is located at the northwest corner of Archibald Avenue and Inland Empire Boulevard. The site is currently developed with retail and service commercial uses, including fast food restaurants, a convenience store, and a self-serve fueling station.

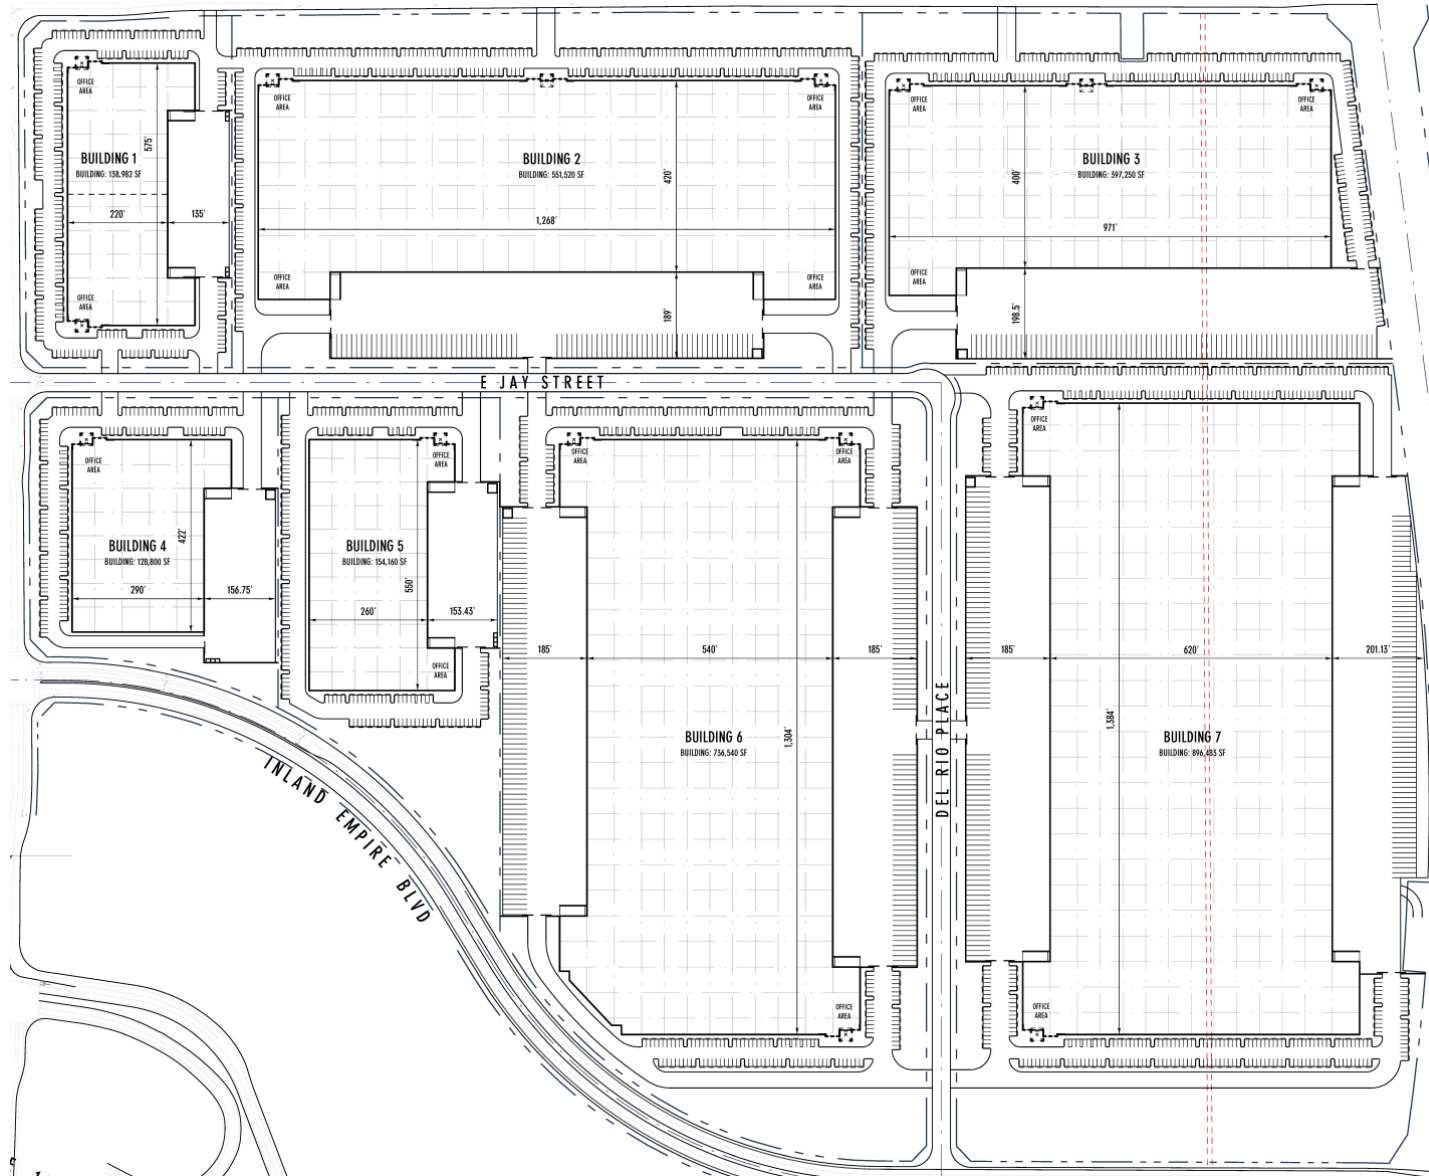

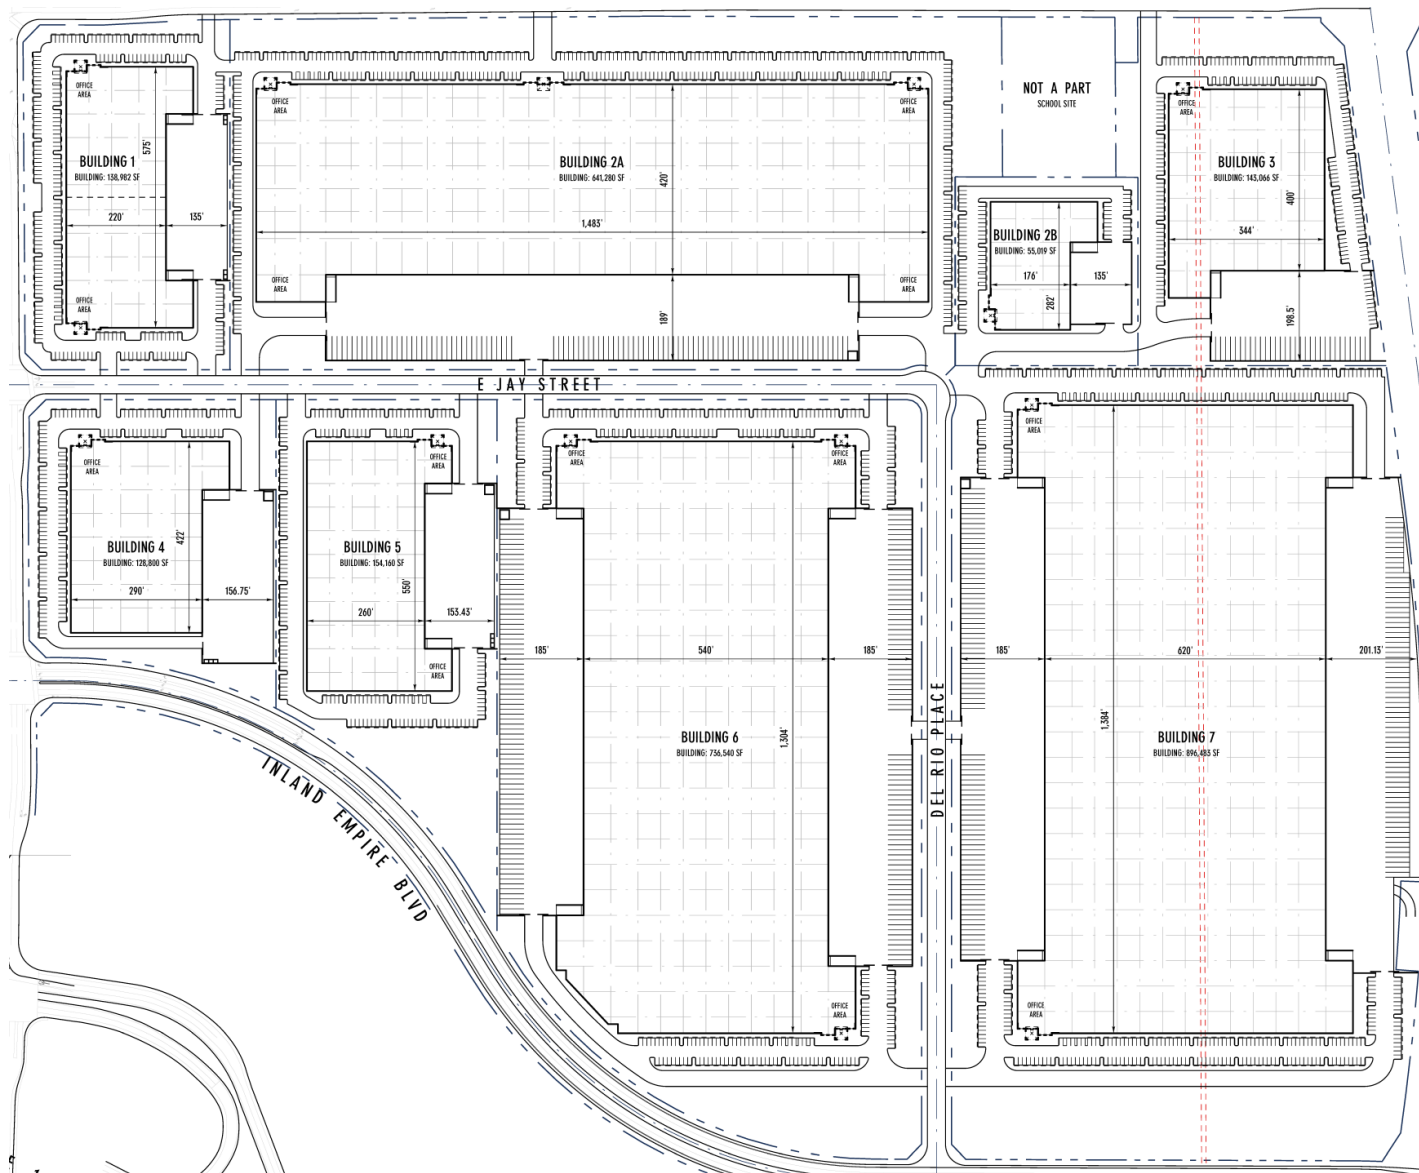

EXHIBIT 1-E: SITE PLAN (OPTION B)

1.4 PROJECT DESIGN FEATURES

Energy-saving and sustainable design features and operational programs would be incorporated into all facilities developed pursuant to the Meredith SPA. Planning Areas 1 through 4 would provide sustainable design features necessary to achieve a “Certified” rating under the United States Green Building Council’s Leadership in Energy & Environmental Design (LEED) programs. The Project also incorporates and expresses the following design features and attributes promoting energy efficiency and sustainability. Because these features/attributes are integral to the Project, and/or are regulatory requirements, they are not considered to be mitigation measures.

- Industrial land uses within the Specific Plan would incorporate the use of solar panels, providing a minimum of 1,600,000 kWh per year of electricity generation, for use within the office portions of industrial buildings;
- All on-site cargo handling equipment (CHE) would be powered by non-diesel fueled engines (e.g., electric or natural gas).
- Regional vehicle miles traveled (VMT) and associated vehicular-source emissions are reduced by the following Project design features/attributes:
 - Pedestrian connections shall be provided to surrounding areas consistent with the City’s General Plan. Providing a pedestrian access network to link areas of the Project site encourages people to walk instead of drive. The Project would provide a pedestrian access network that internally links all uses and connects to all existing or planned external streets and pedestrian facilities contiguous with the project site. The Project would minimize barriers to pedestrian access and interconnectivity
 - The Project’s mixed-use configuration and proposed collocation of Industrial, Urban Commercial and Urban Residential land uses together with supporting amenities would tend to decrease the propensity for, and length of commuter vehicle travel.
- To reduce water demands and associated energy use, subsequent development proposals within the Project site would be required to implement a Water Conservation Strategy and demonstrate a minimum 20% reduction in indoor water usage when compared to baseline water demand (total expected water demand without implementation of the Water Conservation Strategy)¹. Development proposals within the Specific Plan Area would also be required to implement the following:
 - Landscaping palette emphasizing drought tolerant plants consistent with provisions of the Meredith SPA and/or City requirements;
 - Use of water-efficient irrigation techniques consistent with provisions of the Meredith SPA and/or City requirements;
 - U.S. Environmental Protection Agency (EPA) Certified WaterSense labeled or equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.

¹ Reduction of 20% indoor water usage is consistent with the current CalGreen Code performance standards for residential and non-residential land uses. Per CalGreen, the reduction shall be based on the maximum allowable water use per plumbing fixture and fittings as required by the California Building Standards Code.

1.5 MITIGATION MEASURES

No mitigation measures beyond those identified in the *Meredith International Centre Air Quality Impact Analysis* (Urban Crossroads, Inc. 2014) are required since no significant impacts have been identified in this HRA report.

This page intentionally left blank

2 BACKGROUND

2.1 REGULATORY SETTING

CARB estimates that the average Californian is exposed to 1.2-1.8 $\mu\text{g}/\text{m}^3$ of DPM, this exposure results in an average cancer risk of 360-540 in one million for the average Californian exposed to DPM (3).

As noted above, this HRA is based on SCAQMD guidelines to produce conservative estimates of risk posed by exposure to DPM. The conservative nature of this analysis is due primarily to the following factors:

The CARB-adopted diesel exhaust URF of 300 in one million per $\mu\text{g}/\text{m}^3$ is based upon the upper 95 percentile of estimated risk for each of the epidemiological studies utilized to develop the URF. Therefore the risk factor is already representative of the conservative risk posed by DPM.

The risk estimates assume residential receptors will be subject to DPM for 24 hours a day, 350 days a year; worker receptors will be subject to DPM for 12 hours a day, 245 days a year; and school child receptors will be subject to DPM for 10 hours a day, 180 days a year as summarized in Table 2-3 (presented later in the report). As a conservative measure, the SCAQMD does not recognize indoor adjustments for residents, workers, or school children. However, the typical person spends the majority of their time indoors versus remaining outdoors.²

The exposure to DPM is assumed to be constant for the given period analyzed (i.e., 70, 40, 9 years). It should be noted however that emissions from DPM are expected to substantially decrease in the future with the implementation of standard regulatory requirements and technological advancement to reduce DPM.

The emissions derived assume that every truck accessing the project site will idle for 15 minutes, this is an overestimation of actual idling times and thus conservative.³

2.2 EMISSIONS ESTIMATION

Vehicle DPM emissions were estimated using emission factors for particulate matter less than $10\mu\text{m}$ in diameter (PM_{10}) generated with the 2011 version of the Emission FACTor model (EMFAC) developed by the ARB. EMFAC 2011 is a mathematical model that was developed to calculate emission rates from motor vehicles that operate on highways, freeways, and local roads in California and is commonly used by the ARB to project changes in future emissions

² In May, 1991 the California Air Resources Board (CARB) Research Division in association with the University of California, Berkeley published research findings entitled: *Activity Patterns of California Residents*. The findings of that study indicate that on average, adults and adolescents in California spent almost 15 hours per day inside their homes, and six hours in other indoor locations, for a total of 21 hours (87% of the day). About 2 hours per day were spent in transit, and just over 1 hour per day was spent in outdoor locations.

³ Although the Project is required to comply with CARB's idling limit of 5 minutes, staff at SCAQMD recommends that the on-site idling emissions should be estimated for 15 minutes of truck idling (personal communication, phone call, with James Koizumi, May 6, 2009), which would take into account on-site idling which occurs while the trucks are waiting to pull up to the truck bays, idling at the bays, idling at check-in and check-out, etc.

from on-road mobile sources (4). The most recent version of this model, EMFAC 2011, incorporates regional motor vehicle data, information and estimates regarding the distribution of vehicle miles traveled (VMT) by speed, and number of starts per day.

The most important improvement in EMFAC 2011 is the integration of the new data and methods to estimate emissions from diesel trucks and buses. EMFAC 2011 uses the same diesel truck and bus vehicle populations, miles traveled and other emissions-related factors developed for the Truck and Bus Rule approved by the Air Resources Board in 2010. The model includes the emissions benefits of the truck and bus rule and the previously adopted rules for other on-road diesel equipment. Finally, the impacts of the recession on emissions that were quantified as part of the truck and bus rulemaking are included.

Several distinct emission processes are included in EMFAC 2011. Emission factors calculated using EMFAC 2011 are expressed in units of grams per vehicle miles traveled (g/VMT) or grams per idle-hour (g/idle-hr), depending on the emission process. The emission processes and corresponding emission factor units associated with diesel particulate exhaust for this Project are presented below.

For this Project, annual average PM₁₀ emission factors were generated by running EMFAC 2011 in EMFAC Mode for vehicles in the SCAQMD district. The EMFAC Mode generates emission factors in terms of grams of pollutant emitted per vehicle activity and can calculate a matrix of emission factors at specific values of temperature, relative humidity, and vehicle speed. The model was run for speeds traveled in the vicinity of the Project. The vehicle travel speeds for each segment modeled are summarized below. These are average speeds and represent conservative assumptions because lower speeds result in higher emission rates.

- Idling – on-site loading/unloading and truck gate
- 5 miles per hour – on-site vehicle movement including driving and maneuvering
- 25 miles per hour – off-site vehicle movement including driving and maneuvering.

The average PM₁₀ emission factors for each type of vehicle were calculated based on the annual average emission factors from different model years for various exposure periods associated with assumptions for evaluating exposure to different receptor populations (e.g., sensitive, offsite worker and resident, respectively):

- 1) 70-year exposure: 2020 through 2089 (Residential Exposure Scenario)
- 2) 40-year exposure: 2020 through 2059 (Worker Exposure Scenario)
- 3) 9-yr exposure: 2020 through 2028 (School Child Exposure Scenario)

Calculated emission factors for each of these scenarios are shown in Table 2-1. The emission factors for model years beyond 2035 were assumed to be the same as emission factors in 2035 due to the fact that EMFAC 2011 only contains emission factors for the model year from 1990 through 2035. This is a conservative measure as it assumes no fleet turnover or cleaner technology with lower emissions could be incorporated after 2035.

The vehicle DPM exhaust emissions were calculated for running exhaust emissions. The running exhaust emissions were calculated by applying the running exhaust PM10 emission factor (g/VMT) from EMFAC over the total distance traveled. The following equation was used to estimate off-site emissions for each of the different vehicle classes comprising the mobile sources (4):

$$\text{Emissions}_{\text{speedA}} \text{ (g/s)} = \text{EF}_{\text{RunExhaust}} \text{ (g/VMT)} * \text{Distance (VMT/trip)} * \text{Number of Trips (trips/day)} / \text{seconds per day}$$

Where:

$\text{Emissions}_{\text{speedA}}$ (g/s): Vehicle emissions at a given speed A;

$\text{EF}_{\text{RunExhaust}}$ (g/VMT): EMFAC running exhaust PM₁₀ emission factor at speed A;

Distance (VMT/trip): Total distance traveled per trip.

Similar to off-site traffic, on-site vehicle running emissions were calculated by applying the running exhaust PM₁₀ emission factor (g/VMT) from EMFAC and the total vehicle trip number over the length of the driving path using the same formula presented above for on-site emissions. In addition, on-site vehicle idling exhaust emissions were calculated by applying the idle exhaust PM₁₀ emission factor (g/idle-hr) from EMFAC and the total truck trip over the total idle time (15 minutes). The following equation was used to estimate the on-site vehicle idling emissions for each of the different vehicle classes (4):

$$\text{Emissions}_{\text{idle}} \text{ (g/s)} = \text{EF}_{\text{idle}} \text{ (g/hr)} * \text{Number of Trips (trips/day)} * \text{Idling Time (min/trip)} * 60 \text{ minutes per hour} / \text{seconds per day}$$

Where:

$\text{Emissions}_{\text{idle}}$ (g/s): Vehicle emissions during idling;

EF_{idle} (g/s): EMFAC idle exhaust PM₁₀ emission factor.

TABLE 2-1: WEIGHTED AVERAGE DPM EMISSIONS FACTORS

2020-2089 – 70 Year Residential Exposure Scenario	
Speed	Weighted Average
0 (idling)	0.26890 (g/idle-hr)
5	0.06568 (g/s)
25	0.04308 (g/s)
2020-2059 – 40 Year Worker Exposure Scenario	
Speed	Weighted Average
0 (idling)	0.26957(g/idle-hr)
5	0.06658 (g/s)
25	0.04344 (g/s)
2020-2028 – 9 Year School Child Exposure Scenario	
Speed	Weighted Average
0 (idling)	0.27395 (g/idle-hr)
5	0.07464 (g/s)
25	0.04697 (g/s)

Each roadway was modeled as a line source (made up of multiple adjacent volume sources). Due to the large number of volume sources modeled for this analysis, the corresponding coordinates of each volume source have not been included in this report, but are included in Appendix 5.1. The DPM emission rate for each volume source was calculated by multiplying the emission factor (based on the average travel speed along the roadway) by the number of trips and the distance traveled along each roadway segment and dividing the result by the number of volume sources along that roadway, as illustrated in Appendix 5.3. The modeled emission sources are illustrated on Exhibit 2-A. The modeled truck travel routes included in the HRA are based on the truck trip distributions (inbound and outbound) available from the Project’s Traffic Impact Analysis (TIA) (5).

On-site truck idling was estimated to occur as trucks enter and travel through the facility. Although the Project is required to comply with CARB’s idling limit of 5 minutes, staff at SCAQMD recommends that the on-site idling emissions should be estimated for 15 minutes of truck idling (6), which would take into account on-site idling which occurs while the trucks are waiting to pull up to the truck bays, idling at the bays, idling at check-in and check-out, etc. As such, this analysis estimated truck idling at 15 minutes, consistent with SCAQMD’s recommendation.

EXHIBIT 2-A: MODELED EMISSION SOURCES PLANNING AREA 1 OPTION A

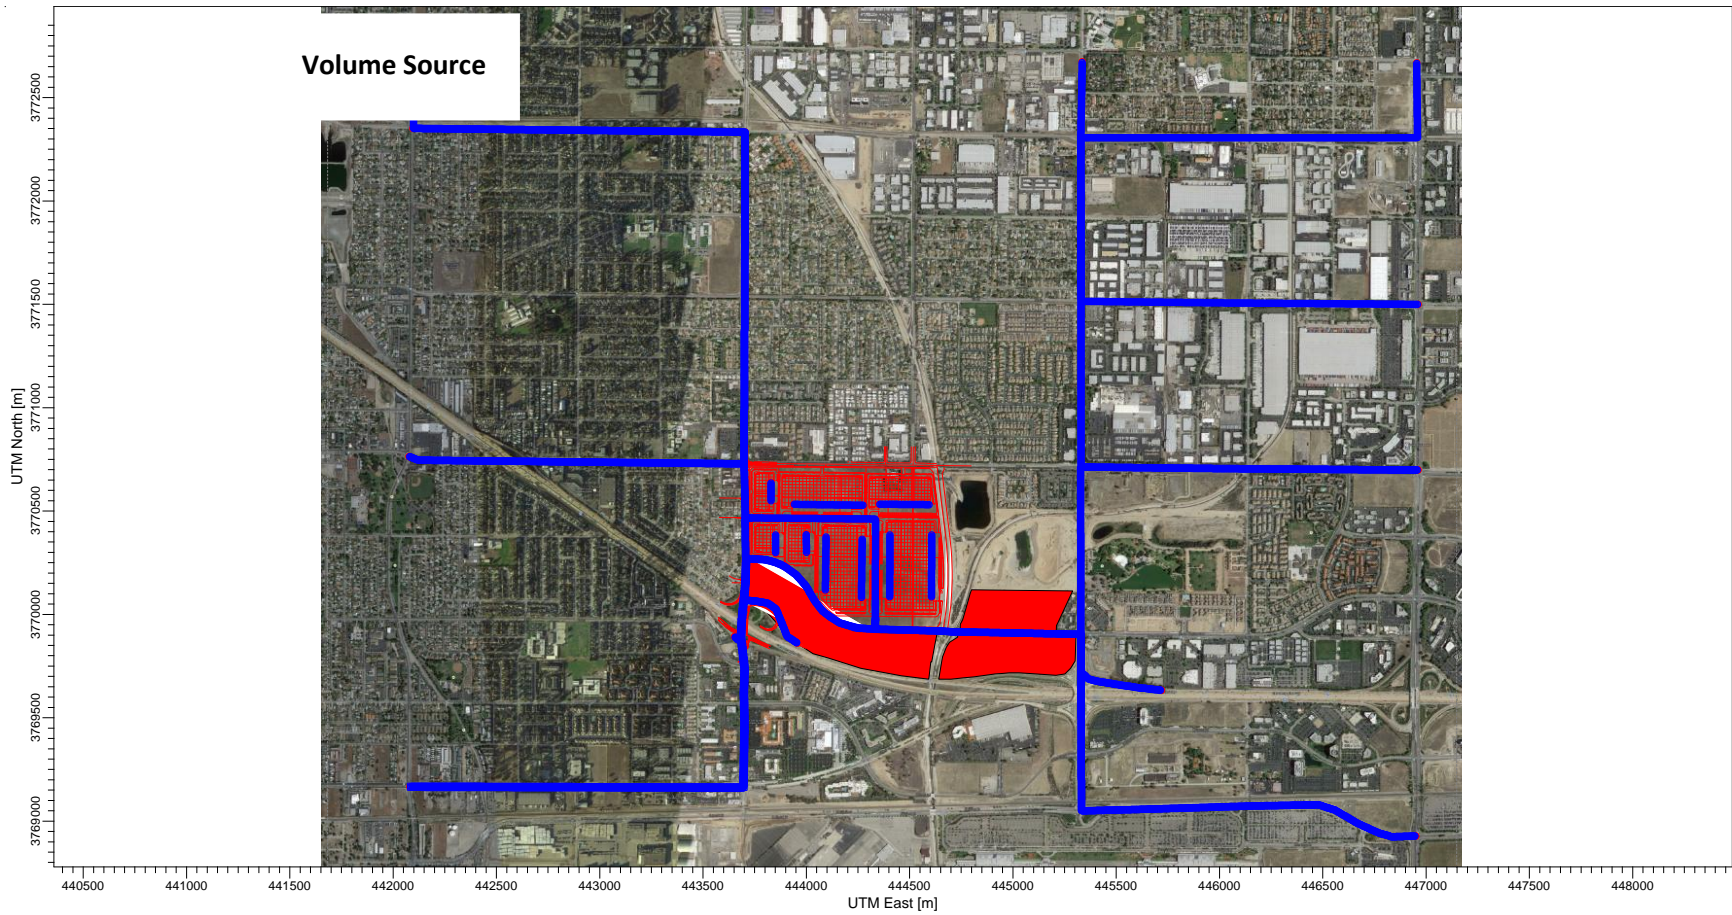

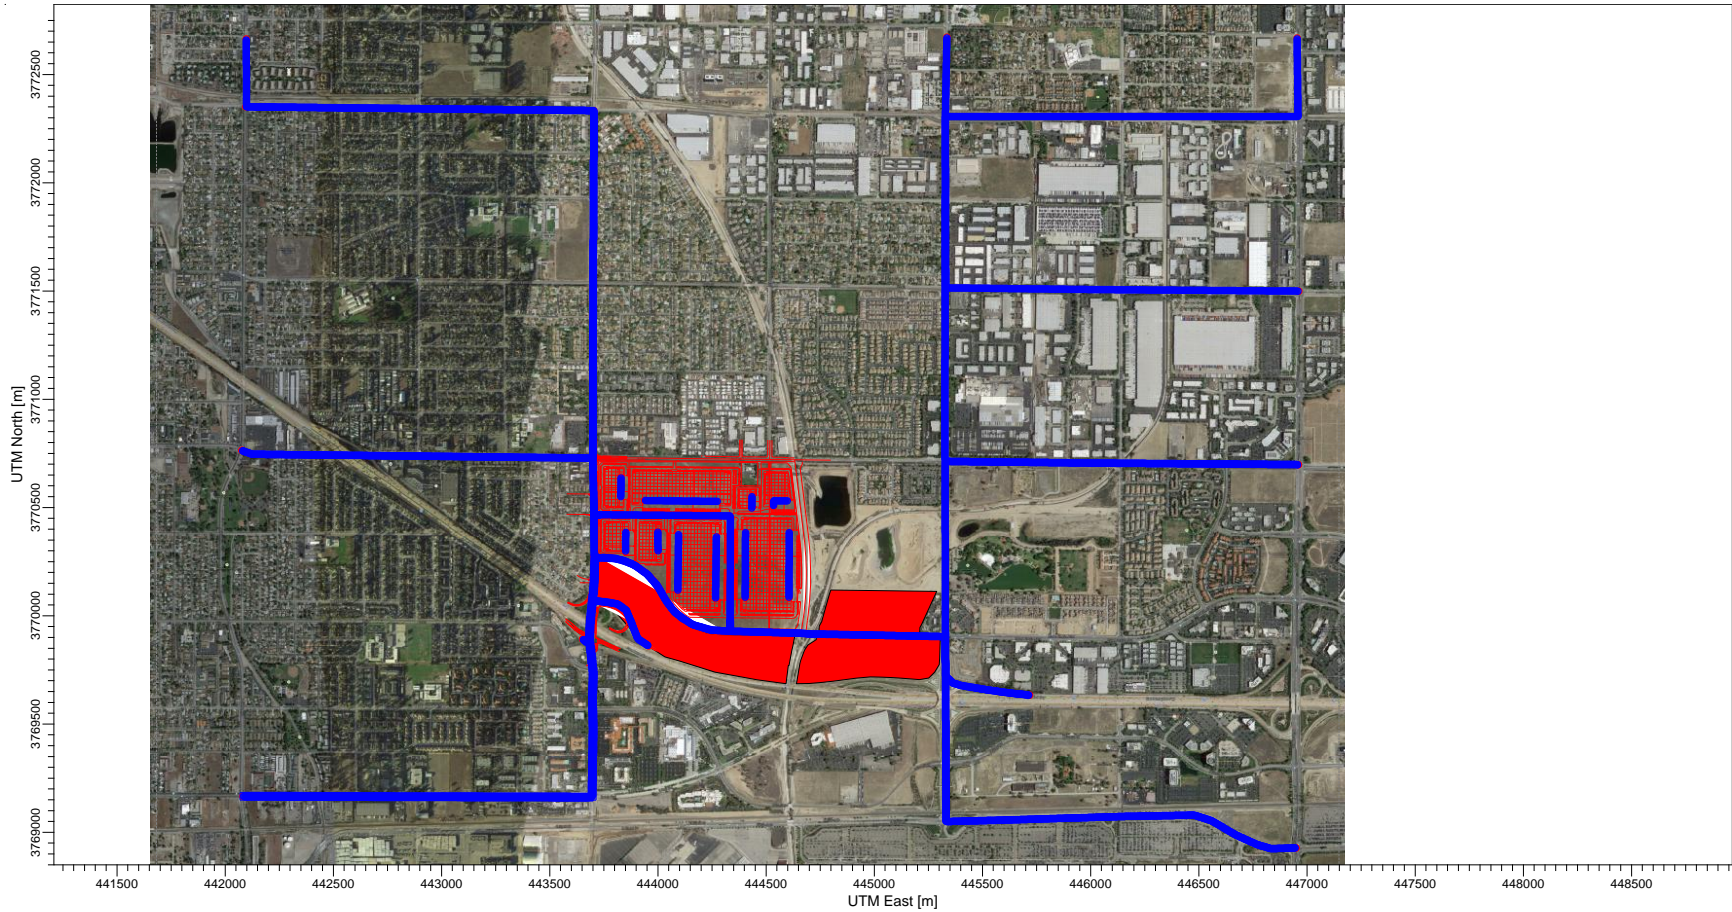

EXHIBIT 2-B: MODELED EMISSION SOURCES PLANNING AREA 1 OPTION B

Trip characteristics available from the report, Meredith International Centre Specific Plan Amendment Traffic Impact Analysis (Linscott Law & Greenspan Engineers) 2014 were utilized in this analysis (7). It should be noted that the Project's traffic study presents the total Project vehicle trips in terms of Passenger Car Equivalent (PCE) in an effort to recognize and acknowledge the effects of heavy vehicles at the study intersections. Notwithstanding, for purposes of this air quality study, the PCE trips were not used. Rather, to more accurately estimate and model vehicular-source emissions, the actual number of vehicles, by vehicle classification (e.g., passenger cars (including light trucks), heavy trucks) were used in the analysis.

For the portion of Planning Area 1 assumed to be developed with industrial uses, (other than high-cube distribution warehouses), the vehicle fleet mix, as derived from the Project TIA, would be approximately 78.60% passenger cars and approximately 21.40% total trucks. Based on information provided in the Project TIA, and for the purposes of this analysis, 37.38% of all trucks are assumed to be Light-Heavy-Duty (LHD), 18.22% of all trucks are assumed to be Medium-Heavy-Duty (MHD), and 44.40% of all trucks are assumed to be Heavy-Heavy-Duty (HHD).

For the portion of Planning Area 1 assumed to be developed with high-cube distribution warehouses, the vehicle fleet mix, as derived from the Project TIA, would be approximately 79.58% passenger cars and approximately 20.42% total trucks. Based on information provided in the Project TIA, and for the purposes of this analysis, 22.71% of all trucks are assumed to be Medium-Heavy-Duty (MHD), and 60.35% of all trucks are assumed to be Heavy-Heavy-Duty (HHD).

2.3 EXPOSURE QUANTIFICATION

The analysis herein has been conducted in accordance with the guidelines in the Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis (1). SCAQMD recommends using the Environmental Protection Agency's (U.S. EPA's) AERMOD model. For purposes of this analysis, the model was used to calculate annual average particulate concentrations associated with site operations.

The model offers additional flexibility by allowing the user to assign an initial release height and vertical dispersion parameters for mobile sources representative of a roadway. For this HRA, the roadways were modeled as adjacent volume sources. According to the AERMOD user's guide, the initial horizontal standard deviation (σ_y) of individual volume sources should be estimated as the distance between adjacent volume sources divided by 2.15. In a similar manner, the AERMOD user guide specifies that the source initial vertical standard deviation (σ_z) for a surface-based source should be estimated as the height of the source divided by a factor of 2.15 (8). The release height of 4 meters was assumed for the diesel trucks, consistent with the methodology used in the Diesel Particulate Matter Exposure Assessment Study for the Ports of Los Angeles and Long Beach prepared by CARB in April 2006, and the vertical (sigma z) dispersion parameter of 1.86 meters was utilized in the AERMOD model (9).

SCAQMD required model parameters are presented in Table 2-2 (8). The model requires additional input parameters including emission data and local meteorology. Meteorological data from the SCAQMD’s Pomona/Walnut Valley (Source Receptor Area 10), which is located less than 8 miles west of the project site, was used to represent local weather conditions and prevailing winds (10).

TABLE 2-2: AERMOD MODEL PARAMETERS

Dispersion Coefficient (Urban/Rural)	Urban
Terrain (Flat/Complex)	Flat
Averaging Time	1 year
Receptor Height	1.5 meters (consistent with SCAQMD protocol)

Universal Transverse Mercator (UTM) coordinates for North American Datum (NAD) 27 were used to locate the project boundaries, each volume source location, and receptor locations in the project vicinity. The AERMOD dispersion model summary output files for the proposed facility are presented in Appendix 5.1.

Modeled sensitive receptors were placed at discrete residential and non-residential locations for the applicable residential and non-residential scenarios.

Discrete variants for daily breathing rates, exposure frequency, and exposure duration were obtained from relevant distribution profiles presented in the OEHHA guidance document entitled Air Toxic Hot Spots Program Risk Assessment Guidelines, Part IV: Technical Support Document for Exposure Assessment and Stochastic Analysis (11) and guidance from SCAQMD. Table 2-3 summarizes the Exposure Parameters for Residents, Offsite Worker, and School Children. Appendix “5.2” includes the detailed emissions and risk calculation outputs. (12)

TABLE 2-3: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK

Exposure Parameter	Units	Residential	Worker	School Child ^a
Exposure Frequency	days/year	350	245	180
Exposure Duration	years	70	40	9
Inhalation Rate ^b	L/kg-day	302	149	581
Exposure Duration	Years	70	40	9
Exposure Time	hours/day	24	12	10

^a To represent the unique characteristics of the school-based population, the assessment employed the U.S. Environmental Protection Agency’s guidance to develop viable dose estimates based on reasonable maximum exposures (RME). RME’s are defined as the “highest exposure that is reasonably expected to occur” for a given receptor population. As a result, lifetime risk values for the student population were adjusted to account for an exposure duration of 180 days per year for nine (9) years. The 9 year exposure duration is also consistent with OEHHA Recommendations and consistent with the exposure duration utilized in school-based risk assessments for various schools within the Los Angeles County Unified School District (LAUSD) that have been accepted by the SCAQMD.

^b The residential breathing rate of 302 L/kg-day represents the 80th percentile breathing rate per ARB and consistent with SCAQMD Risk Assessment Procedures for Rules 1401 and 212, the worker breathing rate of 149 L/kg-day is also consistent with SCAQMD Risk Assessment Procedures for Rules 1401 and 212, the school child breathing rate of 581 L/kg-day represents the high end 95th percentile breathing rate.

Universal Transverse Mercator (UTM) coordinates for North American Datum (NAD) 27 were used to locate the project boundaries, each volume source location, and receptor locations in the project vicinity. The AERMOD dispersion model summary output files for the proposed facility are presented in Appendix 5.1.

2.4 CARCINOGENIC CHEMICAL RISK

The SCAQMD CEQA Air Quality Handbook (1993) states that emissions of toxic air contaminants (TACs) are considered significant if a HRA shows an increased risk of greater than ten in one million. Based on guidance from the SCAQMD in the document Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis (1), for purposes of this analysis, ten (10) in one million is used as the cancer risk threshold for the proposed Project.

Excess cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens over a specified exposure duration. The estimated risk is expressed as a unitless probability. The cancer risk attributed to a chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (e.g., lungs) by the chemical-specific cancer potency factor (CPF). A risk level of 1 in a million implies a likelihood that up to one person, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of toxic air contaminants over a specified duration of time. This risk would be an excess cancer risk that is in addition to any cancer risk borne by a person not exposed to these air toxics.

Guidance from CARB and the California Environmental Protection Agency, Office of Environmental Health Hazard Assessment (OEHHA) recommends a refinement to the standard point estimate approach when alternate human body weights and breathing rates are utilized to assess risk for susceptible subpopulations such as children. For the inhalation pathway, the procedure requires the incorporation of several discrete variates to effectively quantify dose. Once determined, contaminant dose is multiplied by the cancer potency factor (CPF) in units of inverse dose expressed in milligrams per kilogram per day (mg/kg/day)⁻¹ to derive the cancer risk estimate. Therefore, to assess exposures, the following dose algorithm was utilized.

$$DOSE_{air} = (C_{air} \times [BR/BW] \times A \times EF) \times (1 \times 10^{-6})$$

Where:

DOSE _{air}	=	chronic daily intake (mg/kg/day)
C _{air}	=	concentration of contaminant in air (ug/m ³)
[BR/BW] (L/kg BW-day)	=	daily breathing rate normalized to body weight
A	=	inhalation absorption factor
EF	=	exposure frequency (days/365 days)

BW = body weight (kg)
1 x 10⁻⁶ = conversion factors (ug to mg, L to m³)
RISK_{air} = DOSE_{air} x CPF x ED/AT

Where:

DOSE_{air} = chronic daily intake (mg/kg/day)
CPF = cancer potency factor
ED = number of years within particular age group
AT = averaging time

2.5 NON-CARCINOGENIC EXPOSURES

An evaluation of the potential noncarcinogenic effects of chronic exposures was also conducted. Adverse health effects are evaluated by comparing a compound's annual concentration with its toxicity factor or Reference Exposure Level (REL). The REL for diesel particulates was obtained from OEHHA for this analysis. The chronic reference exposure level (REL) for DPM was established by OEHHA as 5 µg/m³ (OEHHA Toxicity Criteria Database, <http://www.oehha.org/risk/chemicaldb/index.asp>).

The non-cancer hazard index was calculated (consistent with SCAQMD methodology) as follows:

The relationship for the non-cancer health effects of DPM is given by the following equation:

$$HI_{DPM} = C_{DPM}/REL_{DPM}$$

Where:

HI_{DPM} = Hazard Index; an expression of the potential for non-cancer health effects.
C_{DPM} = Annual average DPM concentration (µg/m³).
REL_{DPM} = Reference exposure level (REL) for DPM; the DPM concentration at which no adverse health effects are anticipated.

2.6 POTENTIAL PROJECT-RELATED DPM SOURCE CANCER AND NON-CANCER RISKS⁴

Project-related DPM-source cancer and non-cancer risks for Planning Area 1 Option A and Planning Area 1 Option B for residential, worker, and school child exposure scenarios for the Project are considered herein and are summarized as follows.

Modeled sensitive receptors were placed at discrete residential and non-residential locations for the applicable residential and non-residential scenarios as illustrated on Exhibits 2-C, 2-D, and 2-E.

2.6.1 PLANNING AREA 1 OPTION A

Residential Exposure Scenario:

The residential land use with the greatest potential exposure to Project DPM source emissions is located west of N Vineyard Avenue and north of the I-10 freeway just adjacent to the Project site. At the MEIR, the maximum incremental cancer risk attributable to Project DPM source emissions is estimated at 8.22 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0052, which would not exceed the applicable threshold of 1.0. Exhibit 2-C illustrates the nearest modeled residential receptors and the MEIR.

Worker Exposure Scenario:

The worker receptor land use with the greatest potential exposure to Project DPM source emissions is located on-site in the proposed western portion of PA 2 (Urban Commercial land use). At the MEIW, the maximum incremental cancer risk impact at this location is 1.47 in one million which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0047, which would not exceed the applicable threshold of 1.0. Exhibit 2-D illustrates the nearest modeled worker receptors and the MEIW.

School Child Exposure Scenario:

The school site land use with the greatest potential exposure to Project DPM source emissions is located at the Mariposa Elementary School located approximately 0.50 miles (805 meters) southwest of the Project site. At the MEISC, the maximum incremental cancer risk impact at this location is 0.11 in one million which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0056, which would not exceed the applicable threshold of 1.0. Exhibit 2-E illustrates the nearest modeled school receptors and the MEISC.⁵

⁴ SCAQMD guidance does not require assessment of the potential health risk to on-site workers. Excerpts from the document OEHHA Air Toxics Hot Spots Program Risk Assessment Guidelines—The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA 2003), also indicate that it is not necessary to examine the health effects to on-site workers unless required by RCRA (Resource Conservation and Recovery Act) / CERCLA (Comprehensive Environmental Response, Compensation, and Liability Act) or the worker resides on-site.

⁵ The MEISC is at receptor S3 which is located approximately 0.50 miles southwest of the Project site as opposed to receptor S2 which is located 0.13 miles west of the Project site. This due to truck travel patterns and the majority of trucks heading to and from the I-10 freeway to the Project site.

2.6.2 PLANNING AREA 1 OPTION B

Residential Exposure Scenario:

The residential land use with the greatest potential exposure to Project DPM source emissions is located west of N Vineyard Avenue and north of the I-10 freeway just adjacent to the Project site. At the MEIR, the maximum incremental cancer risk attributable to Project DPM source emissions is estimated at 9.44 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0059, which would not exceed the applicable threshold of 1.0. Exhibit 2-C illustrates the nearest modeled residential receptors and the MEIR.⁶

Worker Exposure Scenario:

The worker receptor land use with the greatest potential exposure to Project DPM source emissions is located on-site in the proposed western portion of PA 2 (Urban Commercial land use). At the MEIW, the maximum incremental cancer risk impact at this location is 1.68 in one million which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0053, which would not exceed the applicable threshold of 1.0. Exhibit 2-D illustrates the nearest modeled worker receptors and the MEIW.⁷

School Child Exposure Scenario:

The school site land use with the greatest potential exposure to Project DPM source emissions is located at the Bernt Elementary School located in the northern portion of the site, south of 4th Street. At the MEISC, the maximum incremental cancer risk impact at this location is 1.08 in one million which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0053, which would not exceed the applicable threshold of 1.0. Exhibit 2-D illustrates the nearest modeled school receptors and the MEISC.⁸

6 The increased cancer risk and non-cancer risk at the MEIR under Development Option B is due largely to the increase in warehouse floor area in an area of the Project site proximate to the MEIR (Option B-Building No. 2A @ 641,280 sf vs. Option A-Building No.2 @ 551,520 sf), and related increase in truck traffic at this location.

7 The increased cancer risk and non-cancer risk at the MEIW under Development Option B is due largely to the increase in warehouse floor area in an area of the Project site proximate to the MEIW, and related increase in truck traffic at this location.

8 The increased cancer risk and non-cancer risk at the MEISC under Development Option B is due largely to decreased source-receptor separation. That is, under Development Option A, the MEISC location (the Mariposa Elementary School) is approximately 0.50 miles southwest of the Project site. In comparison, under Development Option B, the MEISC location (the Bernt Elementary School) abuts the Project site.

EXHIBIT 2-E: NEAREST MODELED SCHOOL CHILD RECEPTORS

2.7 CUMULATIVE TOXIC AIR CONTAMINANTS (TAC) EMISSIONS IMPACTS

As a first step in determining a cumulative threshold for cumulative toxic air contaminant The South Coast Air Quality Management District (SCAQMD)⁹ has conducted an analysis of the cumulative effects of Toxic Air Contaminants (TACs) within the South Coast Air Basin (Basin). This cumulative analysis, *Multiple Air Toxics Exposure Study in the South Coast Air Basin (MATES-III)*, expresses cumulative TAC impacts in terms of potential increased cancer risks.¹⁰ *MATES-III* estimates that the Basin-wide average excess cancer risk level resulting from exposure to cumulative TACs is approximately 1,200 incidents per one million population. Related, *MATES-III* estimates the cumulative TAC-source cancer risk for the localized area encompassing the Project site at 1,096 to 1,426 incidents per million population.¹¹ DPM-source cancer risks, are reflected in the area's ambient cumulative cancer risk along with all other TAC-source risks, and accounts for the predominance (83.6%) of the total risk shown in *MATES-III*. For the purposes of this analysis, the greatest *MATES-III* cumulative exposure incidence affecting the Project site (1,426 incidents per million) is employed.

2.7.1 EXISTING CONDITIONS FOR TOXIC EMISSIONS

There are no state or federal ambient air quality standards applicable to TAC emissions. Preparing a cumulative assessment for TACs is complicated by the fact that site-specific impacts can be far different from average impacts over a larger geographic area. Impacts from TAC emissions are highest closest to sources of TACs, but the sources are often spread over a large area. For example, emissions from diesel engines, the largest source of risk from TACs, are operated on roads, businesses, and construction sites throughout the air basin. Locations where large numbers of TAC sources are concentrated such as freeways, railyards, and ports may pose a higher level of risk to sensitive receptors near these facilities. Examination of the risk from TACs at national, state, regional, and local levels is useful for providing context, but site-specific evaluation is ultimately necessary to determine existing conditions for development projects.

2.7.2 AMBIENT TAC IMPACTS PRESUMED CUMULATIVELY SIGNIFICANT

The SCAQMD *has* established a significance threshold for incremental *project-level* TAC impacts. Specifically, if a given project would generate TACs resulting in or causing an increase in cancer risks of 10 or more incidents per million population, that project's incremental cancer risk would be considered significant. This same significance threshold (10 in one million) is applied by SCAQMD in determining whether a given project's incremental contribution to ambient TAC-source cancer risks is cumulatively considerable. The SCAQMD *has not* however established a

9 SCAQMD is the Responsible Agency providing guidance on applicable air quality analysis methodologies and air quality-related issues.

10 Cancer risk refers to the probability of contracting cancer associated with exposure to a substance. It is expressed as the chance per million of a cancer case occurring. A risk of one per million, for example, would mean that in a population of one million individuals exposed over a 70 year lifetime, one additional cancer case would be expected.

11 SCAQMD 2008, *MATES III Carcinogenic Interactive Map*—<http://www3.aqmd.gov/webappl/matesiii/> Localized background TAC-source cancer risk estimates are extrapolated from TAC monitoring data collected at ten fixed sites within the South Coast Air Basin. *MATES III* extrapolates cancer risk levels throughout the Basin at 1.25 mile by 1.25 mile grids.

significance threshold for ambient cumulative TAC impacts affecting the Basin. Likewise, the Lead Agency has no adopted cumulative TAC impacts significance threshold.

Absent an established threshold for cumulative TAC impacts, the following discussion assesses whether, in the light of other available existing information, the ambient cumulative TAC-source impacts affecting the Basin and the area encompassing the Project site could be characterized as significant.

As noted previously, MATES-III estimates the average ambient cumulative TAC-source cancer risk for the Basin as whole at 1,200 incidents per million population; in the localized area encompassing the Project site the risk is estimated at 1,515 incidents per million population. Either of these existing cumulative TAC-source cancer risk levels (1,200 per million, or 1,515 per million) far exceeds the 10 in one million cancer risk at which project-level TAC-source cancer risks would be determined significant employing SCAQMD thresholds.

Comparing the ambient cumulative TAC-source cancer risk (1,200 per million Basin-wide; or 1,515 per million locally) to the SCAQMD's established threshold for project-level TAC-source cancer risks (10 in one million), the ambient cumulative TAC-source cancer risk is approximately 120 to 151.5 greater than the incremental risk at which project-level TAC-source cancer risks would be considered significant.

Although there is not yet an established significance threshold for ambient cumulative TAC impacts, given the magnitude by which the ambient cumulative condition exceeds SCAQMD's established project-level significance threshold (ambient cumulative TAC conditions are 120 to 151.5 greater than the project-level threshold), the ambient cumulative condition would likely exceed whatever significance threshold may be established for cumulative impacts affecting the Basin. On this basis and absent a prevailing threshold adopted by the Lead or Responsible Agency, ambient cumulative TAC impacts are presumed to be significant.

2.7.3 JUSTIFICATION OF THE GEOGRAPHIC SCOPE OF THE ANALYSIS

Proximity to sources of toxics is critical to determining the impact. In traffic-related studies, the additional non-cancer health risk attributable to proximity was seen within 1,000 feet and was strongest within 300 feet. California freeway studies show about a 70-percent drop-off in particulate pollution levels at 500 feet. Based on ARB and South Coast District emissions and modeling analyses, an 80-percent drop-off in pollutant concentrations is estimated at approximately 1,000 feet from a distribution center (13).

The 1,000-foot evaluation distance is supported by research-based findings concerning TAC emission dispersion rates from roadways and large sources showing that emissions diminish substantially between 500 and 1,000 feet from emission sources.

For assessing the cumulative impacts of a new source of TAC emissions associated with a project in combination with existing sources and probable future sources, a project radius is necessary. Assessment of impacts from existing sources within 1,000 feet of the new source in combination with risks and hazards from the new source is recommended. Then, once the

location of the maximally impacted receptor is identified for the project, cumulative impacts from other sources within the radius of the project (i.e., not the receptor) are assessed at that location. Assessments should sum individual hazards or risks to find the cumulative impact at the location of the maximally impacted receptor from the new source.

Lastly, the Waters Bill (AB 3205) (H&SC Section, 42301.6 through 42301.9) (14) addresses sources of hazardous air pollutants near schools. It requires new or modified sources of hazardous air emissions located within 1,000 feet from the outer boundary of a school to give public notice to the parents or guardians of children enrolled in any school located within one-quarter mile of the source and to each address within a 1,000 foot radius.

For purposes of this assessment, a one-quarter mile radius or 1,320 feet geographic scope is utilized for determining potential cumulative impacts. This radius is more robust than, and provides a more health protective scenario for evaluation than the 1,000 feet buffer identified above.

2.7.4 RELATED PROJECTS CONTRIBUTION TO CUMULATIVE TAC IMPACTS

In addition to the MATES-III cumulative TAC-source cancer risk noted above, other new or proposed potential TAC-generating projects (related projects) in the Study Area could contribute to cumulative TAC impacts. These related projects, due to their recent and/or tentative nature, are not reflected in the cumulative TAC impacts identified in the MATES-III study.

In consultation with the Lead Agency, related TAC-generating projects located within a one-quarter mile radius of the Project were identified and are reflected in this cumulative TAC analysis. The related projects listed below were selected based on their propensity to generate TACs that would contribute to, or interact with, TACs generated by the Project. Related projects include:

Of the 68 cumulative projects identified in the Project's traffic study, 3 cumulative projects are located within the quarter-mile buffer as follows:

- No. 2: Warmington Residential (57 DU Single-Family Residential)
- No. 3: Parkside (150 DU Condominiums, and 100 DU Single-Family Residential)
- No. 4: Guasti (197,820 square feet Shopping Center and 114,654 square feet Office Building)

Of the 3 cumulative projects considered, only cumulative project No. 4 has the potential to emit TACs (15). The primary TAC-source emission associated with cumulative project No. 4 would be DPM associated with any truck trips associated with the proposed shopping center and office building. No environmental documentation is currently available that discloses the potential health risks associated with the proposed Shopping Center and Office Building uses. Based on Urban Crossroads' professional experience in preparing risk assessments for like facilities, the health risks associated with the Shopping Center and Office Building would not exceed 5 incidents per million population.

2.7.5 PROJECT MAXIMUM CONTRIBUTION TO CUMULATIVE TAC IMPACTS

Project-source TACs would incrementally increase the background cancer risk by a maximum of 9.44 incidents per million population. The applicable SCAQMD significance threshold for Project-level TAC-source cancer risk impacts is 10 incidents per million population. Similarly, SCAQMD significance thresholds state that Project contributions to cumulative TAC-source cancer risks would be cumulatively considerable if greater than 10 incidents per million population would occur. The 9.44 incidents per million population increment resulting from the Project is therefore not significant, nor cumulatively considerable.

2.7.6 CUMULATIVE IMPACTS BY DEVELOPMENT OPTION AND EXPOSURE SCENARIO

As noted above at Section 2.7.5, the Project's maximum contribution to cumulative TAC Impacts would not be cumulatively considerable. For informational and disclosure purposes, cumulative TAC impacts are further defined for each potential exposure scenario (residential, worker and school child) under the Project's Development Options "A" and "B," and are summarized below.

PLANNING AREA 1 OPTION A

Residential Exposure Scenario:

At the MEIR, the greatest potential cumulative with Project cancer risk is estimated at 1,439.22 in one million. The Project's maximum incremental contribution to the cumulative health risk is 8.22 in one million which is not above the 10 in one million incremental threshold set by SCAQMD, and is therefore less-than-significant. Accordingly, pursuant to SCAQMD cumulative impact criteria, the Project's contribution to cumulative TAC-source cancer risks at the MEIR would not be cumulatively considerable.

Worker Exposure Scenario:

At the MEIW, the greatest potential cumulative with Project cancer risk is estimated at 1,432.47 in one million. The Project's maximum incremental contribution to the cumulative health is 1.47 in one million which is not above the 10 in one million incremental threshold set by SCAQMD, and is therefore less-than-significant. Accordingly, pursuant to SCAQMD cumulative impact criteria, the Project's contribution to cumulative TAC-source cancer risks at the MEIW would not be cumulatively considerable.

School Child Exposure Scenario:

At the MEISC, the greatest potential cumulative with Project cancer risk is estimated at 1,431.11 in one million. The Project's maximum incremental contribution to the cumulative health is 0.11 in one million which is not above the 10 in one million incremental threshold set by SCAQMD, and is therefore less-than-significant. Accordingly, pursuant to SCAQMD cumulative impact criteria, the Project's contribution to cumulative TAC-source cancer risks at the MEISC would not be cumulatively considerable.

PLANNING AREA 1 OPTION B

Residential Exposure Scenario:

At the MEIR, the greatest potential cumulative with Project cancer risk is estimated at 1,440.44 in one million. The Project's maximum incremental contribution to the cumulative health risk is 9.44 in one million which is not above the 10 in one million incremental threshold set by SCAQMD, and is therefore less-than-significant. Accordingly, pursuant to SCAQMD cumulative impact criteria, the Project's contribution to cumulative TAC-source cancer risks at the MEIR would not be cumulatively considerable.

Worker Exposure Scenario:

At the MEIW, the greatest potential cumulative with Project cancer risk is estimated at 1,432.68 in one million. The Project's maximum incremental contribution to the cumulative health is 1.68 in one million which is not above the 10 in one million incremental threshold set by SCAQMD, and is therefore less-than-significant. Accordingly, pursuant to SCAQMD cumulative impact criteria, the Project's contribution to cumulative TAC-source cancer risks at the MEIW would not be cumulatively considerable.

School Child Exposure Scenario:

At the MEISC, the greatest potential cumulative with Project cancer risk is estimated at 1,431.63 in one million. The Project's maximum incremental contribution to the cumulative health is 0.625 in one million which is not above the 10 in one million incremental threshold set by SCAQMD, and is therefore less-than-significant. Accordingly, pursuant to SCAQMD cumulative impact criteria, the Project's contribution to cumulative TAC-source cancer risks at the MEISC would not be cumulatively considerable.

2.7.6 SUMMARY AND CONCLUSIONS

To provide context for, and quantify cumulative TAC effects within the Study Area, the Project TAC-source cancer risk, and the TAC-source cancer risks from the related projects identified herein, were added to the total background risk derived by the MATES III study, yielding a maximum potential cumulative TAC-source risk affecting the Study Area. As indicated at Table 2-4 and 2-5 the maximum potential cumulative cancer risk within the Study Area is estimated at 1,426.

The MATES-III ambient cumulative TAC impact represents approximately 99.1 percent of the total cumulative impact identified at Table 2-4 for Planning Area 1 Option A and at Table 2-5 for Planning Area 1 Option B; and due to its magnitude when compared to project-level TAC impact significance thresholds, is presumed to be cumulatively significant. The Project would incrementally contribute to this presumably significant cumulative impact. However the Project's maximum incremental contribution of 9.44 incidents per million population do not exceed the established SCAQMD threshold (10 incidents per million population) at which

project-level TAC contributions would be determined cumulatively considerable. On this basis, the Project TAC emissions impacts are not considered cumulatively considerable.

TABLE 2-4: STUDY AREA CUMULATIVE CANCER RISK PLANNING AREA 1 OPTION A¹²

	Cancer Risk as Maximum Sensitive Receptor (risk in one million)			
	Background TACs	Related Projects TACs	Project TACs	Maximum Cumulative Risk
Maximum Impact to All Receptors Without Project	1,426	5.0		1,426
Maximum Impact to Nearest Residential With Project	1,426	5.0	8.22	1,439.22
Maximum Impact to Nearest Worker With Project	1,426	5.0	1.47	1,432.47

¹² Although cumulative impacts typically represent a General Plan Buildout Scenario, there is no such data available for what General Plan Buildout DPM emissions impacts would be. The background risk, however, would likely overstate, rather than understate future DPM impacts and is assumed to be inclusive of future growth. It should be noted that due to improved DPM emissions control technologies and increasingly stringent DPM emissions regulations, the cancer risk incidence in the seven (7) years between the Mates II and Mates III studies declined by approximately 15% even as population and business growth occurred throughout the region. Similar future declines in area-wide DPM source emissions are anticipated pursuant to enactment of further emissions regulations, including but not limited to anticipated greenhouse gas (GHG) reduction and control measures to be implemented by the state (see also: emissions regulatory measures discussed within Meredith International Centre Specific Plan Amendment Air Quality Impact Analysis (Urban Crossroads) 2014; and Meredith International Centre Specific Plan Amendment Greenhouse Gas Impact Analysis (Urban Crossroads) 2014.

EDUCATION

Master of Science in Environmental Studies
California State University, Fullerton • May, 2010

Bachelor of Arts in Environmental Analysis and Design
University of California, Irvine • June, 2006

PROFESSIONAL AFFILIATIONS

AEP – Association of Environmental Planners
AWMA – Air and Waste Management Association
ASTM – American Society for Testing and Materials

PROFESSIONAL CERTIFICATIONS

Planned Communities and Urban Infill – Urban Land Institute • June, 2011
Indoor Air Quality and Industrial Hygiene – EMSL Analytical • April, 2008
Principles of Ambient Air Monitoring – California Air Resources Board • August, 2007
AB2588 Regulatory Standards – Trinity Consultants • November, 2006
Air Dispersion Modeling – Lakes Environmental • June, 2006

**MODELOPTs: NonDEFAULT CONC FLAT FLGPOL FASTALL

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 4957 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 2015355.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTALL - Use effective sigma-y to optimize meander for
POINT and VOLUME sources, and hybrid approach
to optimize AREA sources (formerly TOXICS option)

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: DPM

**Model Calculates ANNUAL Averages Only

**This Run Includes: 4957 Source(s); 1 Source Group(s); and
302 Receptor(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 12345

**Output Options Selected:

Model Outputs Tables of ANNUAL Averages by Receptor

Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours
m for
Missing Hours
b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 270.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 5.6 MB of RAM.

**Detailed Error/Message File: residential.err
**File for Summary of Results: residential.sum

**MODELOPTs: NonDEFAULT CONC FLAT FLGPOL FASTALL

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 4957 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 2015355.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTALL - Use effective sigma-y to optimize meander for
POINT and VOLUME sources, and hybrid approach
to optimize AREA sources (formerly TOXICS option)

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: DPM

**Model Calculates ANNUAL Averages Only

**This Run Includes: 4957 Source(s); 1 Source Group(s); and
107 Receptor(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 12345

**Output Options Selected:

Model Outputs Tables of ANNUAL Averages by Receptor

Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours
m for
Missing Hours
b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 270.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 5.6 MB of RAM.

**Detailed Error/Message File: workers.err
**File for Summary of Results: workers.sum
