1 INTRODUCTION

This report presents the results of the traffic impact analysis (TIA) for the proposed Colony Commerce Center East Specific Plan (“Project”), which is located on the southwest corner of Archibald Avenue and Merrill Avenue in the City of Ontario, as shown on Exhibit 1-1.

The purpose of this TIA is to evaluate the potential circulation system deficiencies that may result from the development of the proposed Project, and to recommend improvements to achieve acceptable circulation system operational conditions. As directed by City of Ontario staff, this traffic study has been prepared in accordance with the San Bernardino County Transportation Authority (SBCTA) Congestion Management Program (CMP) *Guidelines for CMP Traffic Impact Analysis Reports* (Appendix B, 2016 Update), the California Department of Transportation (Caltrans) *Guide for the Preparation of Traffic Impact Studies* (December 2002), and consultation with City staff during the scoping process. (1) (2) The approved Project Traffic Study Scoping agreement is provided in Appendix 1.1 of this TIA.

1.1 PROJECT OVERVIEW

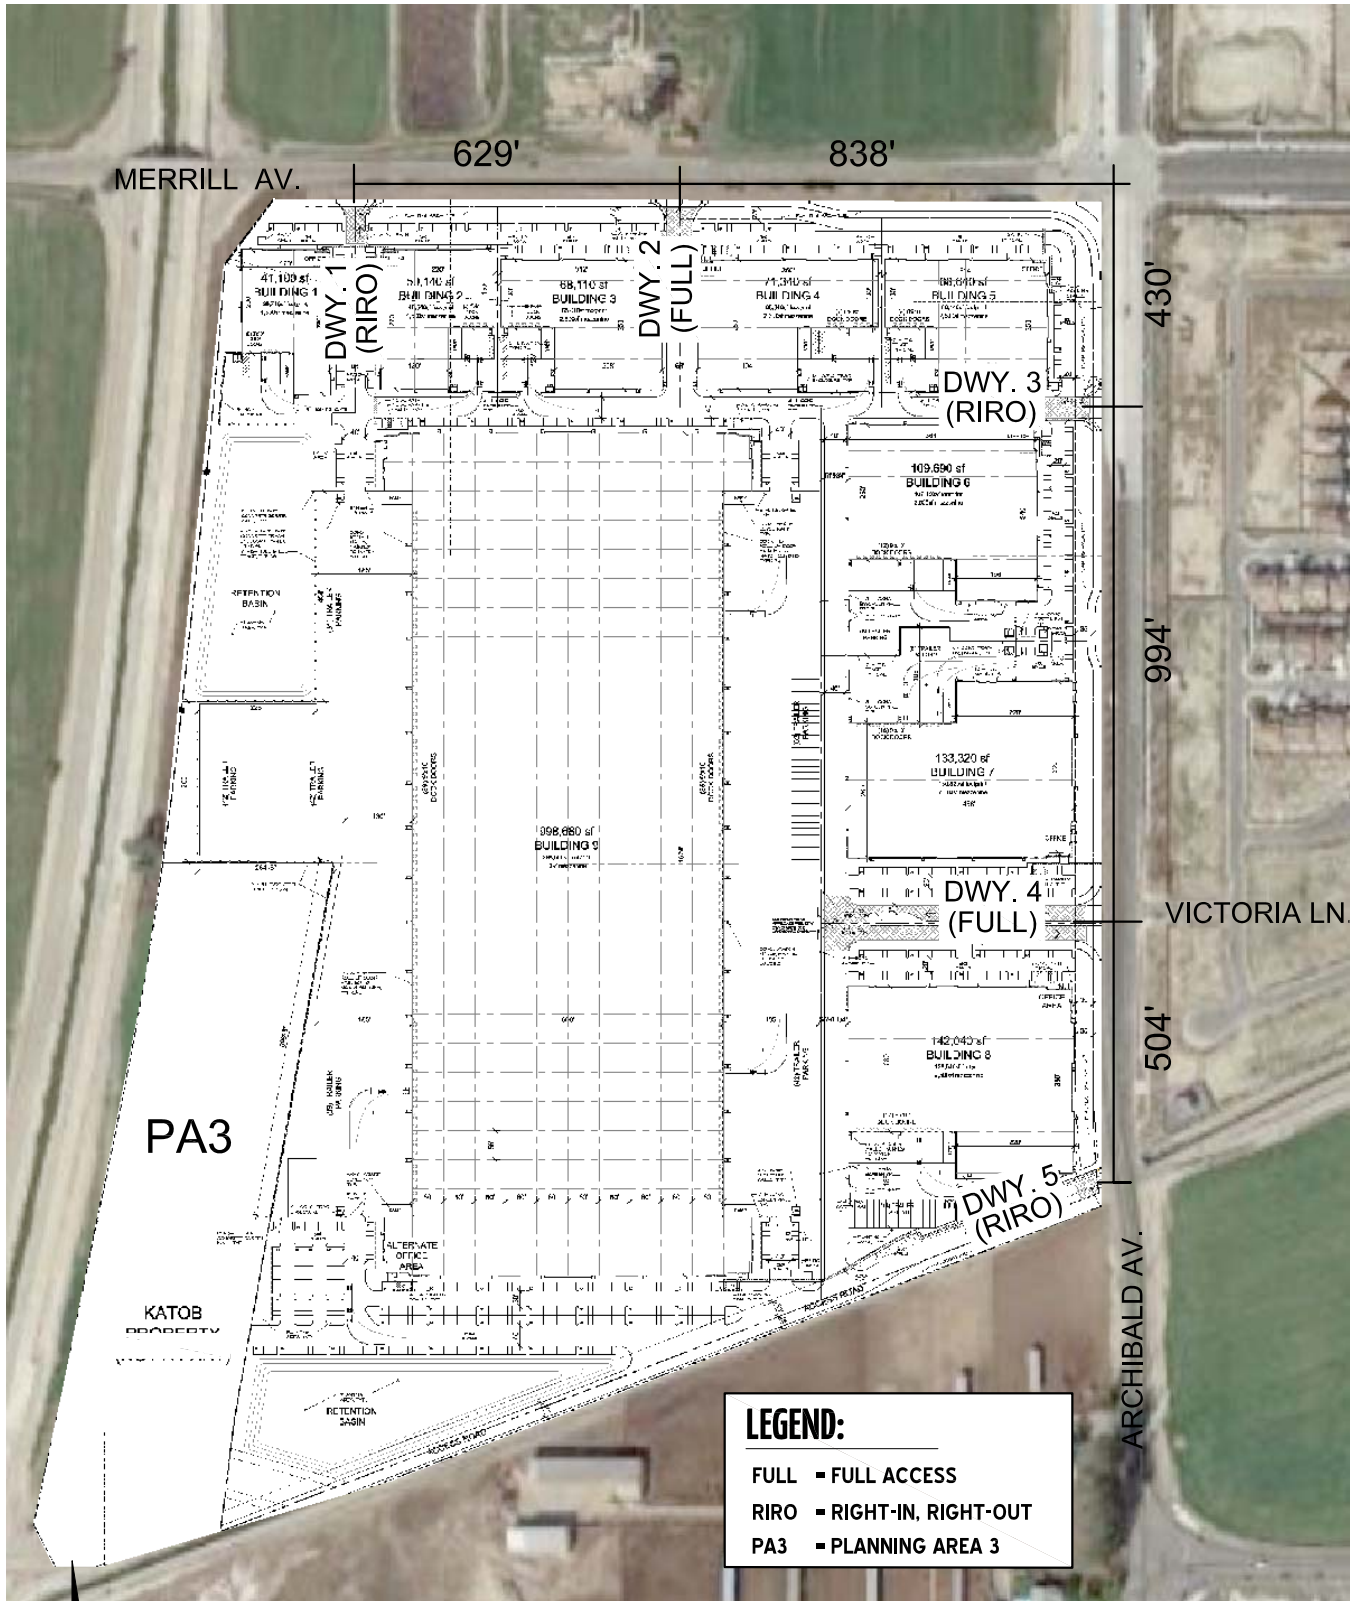

Exhibit 1-1 illustrates the preliminary Project site plan. The proposed Project would develop and operate the Colony Commerce Center East Specific Plan. The Specific Plan contains three Planning Areas. Planning Area (PA) 1 and PA2 of the Specific Plan is anticipated to be operational by 2019. The remaining PA3 is proposed to be developed with up to 231,195 square feet (sf) of industrial use; however, the timeline for development is unknown, and dependent upon economic conditions and full occupancy of PA1 and PA2. However, this analysis assumes that PA-3 would be developed and operational by 2040.

As indicated on Exhibit 1-1, the total development of PA1 and PA2 is proposed to consist of up to 175,330-sf of manufacturing use (25 percent of the square footage for Buildings 1 through 8), 525,991-sf of warehousing use (75 percent of the square footage for Buildings 1 through 8), and 998,680-sf high-cube warehouse/distribution center use (Building 9). Similarly, PA3 would develop consist of up to 57,799-sf of manufacturing use (25 percent of the square footage), 173,396-sf of warehousing use (75 percent of the square footage).

Regional access to the Project is provided by the State Route 71 (SR-71), State Route 60 (SR-60) and Interstate 15 (I-15) freeways. Vehicular and truck traffic access will be provided via the following driveways:

- Driveway 1 / Merrill Avenue – Right-in/right-out driveway providing access to both passenger cars and trucks for Buildings 1, 2, and 9
- Driveway 2 / Merrill Avenue – Full access driveway providing access to both passenger cars and trucks for Buildings 3, 4, 5, 6, and 9
- Archibald Avenue / Driveway 3 – Right-in/right-out driveway providing access to passenger cars and trucks for Buildings 5, 6, and 9

EXHIBIT 1-1: PRELIMINARY SITE PLAN

LEGEND:

- FULL ■ FULL ACCESS
- RIRO ■ RIGHT-IN, RIGHT-OUT
- PA3 ■ PLANNING AREA 3

- Archibald Avenue / Driveway 4 – Full access driveway providing access to both passenger cars and trucks for Buildings 6, 7, 8, and 9
- Archibald Avenue / Driveway 5 – Right-in/right-out driveway providing access to passenger cars and trucks for Buildings 8 and 9

Trips generated by the Project's proposed land uses have been estimated based on trip generation rates collected by the Institute of Transportation Engineers (ITE) *Trip Generation Manual*, 10th Edition, 2017. (3) The proposed Project is anticipated to generate a net total of 4,109 passenger car equivalent (PCE) trip-ends per day, 371 PCE AM peak hour trips and 424 PCE PM peak hour trips for Opening Year Cumulative traffic conditions. The proposed Project is anticipated to generate a net total of 4,782 PCE trip-ends per day, 454 PCE AM peak hour trips and 514 PCE PM peak hour trips with the addition of PA3 for Horizon Year (2040) traffic conditions. The assumptions and methods used to estimate the Project's trip generation characteristics are discussed in greater detail in Section 4.1 *Project Trip Generation* of this report.

1.2 ANALYSIS SCENARIOS

For the purposes of this traffic study, potential impacts to traffic and circulation have been assessed for each of the following conditions:

- Existing (2017)
- Existing plus Project (E+P)
- Opening Year Cumulative (2019) Without Project
- Opening Year Cumulative (2019) With Project
- Horizon Year (2040) Without Project
- Horizon Year (2040) With Project

1.2.1 EXISTING (2017) CONDITIONS

Information for Existing (2017) conditions is disclosed to represent the baseline traffic conditions as they existed at the time this report was prepared.

1.2.2 EXISTING PLUS PROJECT CONDITIONS

The Existing Plus Project (E+P) analysis determines circulation system deficiencies that would occur on the existing roadway system in the scenario of the Project being placed upon Existing conditions. The E+P analysis is intended to identify the project-specific traffic impacts associated solely with the development of the proposed Project based on a comparison of the E+P traffic conditions to Existing (2017) conditions.

1.2.3 OPENING YEAR CUMULATIVE CONDITIONS

The Opening Year Cumulative traffic conditions analyses determine the potential near-term cumulative circulation system deficiencies. To account for background traffic growth, traffic associated with other known cumulative development projects in conjunction with an ambient

growth factor from Existing conditions of 2.0% (for 2019 conditions) are included for Opening Year Cumulative traffic conditions. This comprehensive list was compiled from information provided by the City of Ontario and other near-by agencies.

1.2.4 HORIZON YEAR (2040) CONDITIONS

Traffic projections for Horizon Year (2040) with Project conditions were derived from the San Bernardino Transportation Analysis Model (SBTAM) modified to represent buildout of the City of Ontario. Forecasts for the proposed Project include the development of PA1, PA2, and PA3 under Horizon Year (2040) With Project traffic conditions. The Horizon Year (2040) conditions analysis will be utilized to determine if improvements funded through regional transportation mitigation fee programs, such as the City's Development Impact Fee (DIF) program, or other approved funding mechanisms can accommodate the long-range cumulative traffic at the target level of service (LOS) identified by the City of Ontario (lead agency). It should be noted that the City of Ontario has updated their DIF program to also include appropriate contributions towards regionally significant improvements that have been identified via the San Bernardino County CMP regional fee program study. If the planned and funded improvements can provide the target LOS, then the Project's payment into established fee programs will be considered as cumulative mitigation. Other improvements needed beyond the "funded" improvements (such as localized improvements to non-DIF facilities) are identified as such.

1.3 STUDY AREA

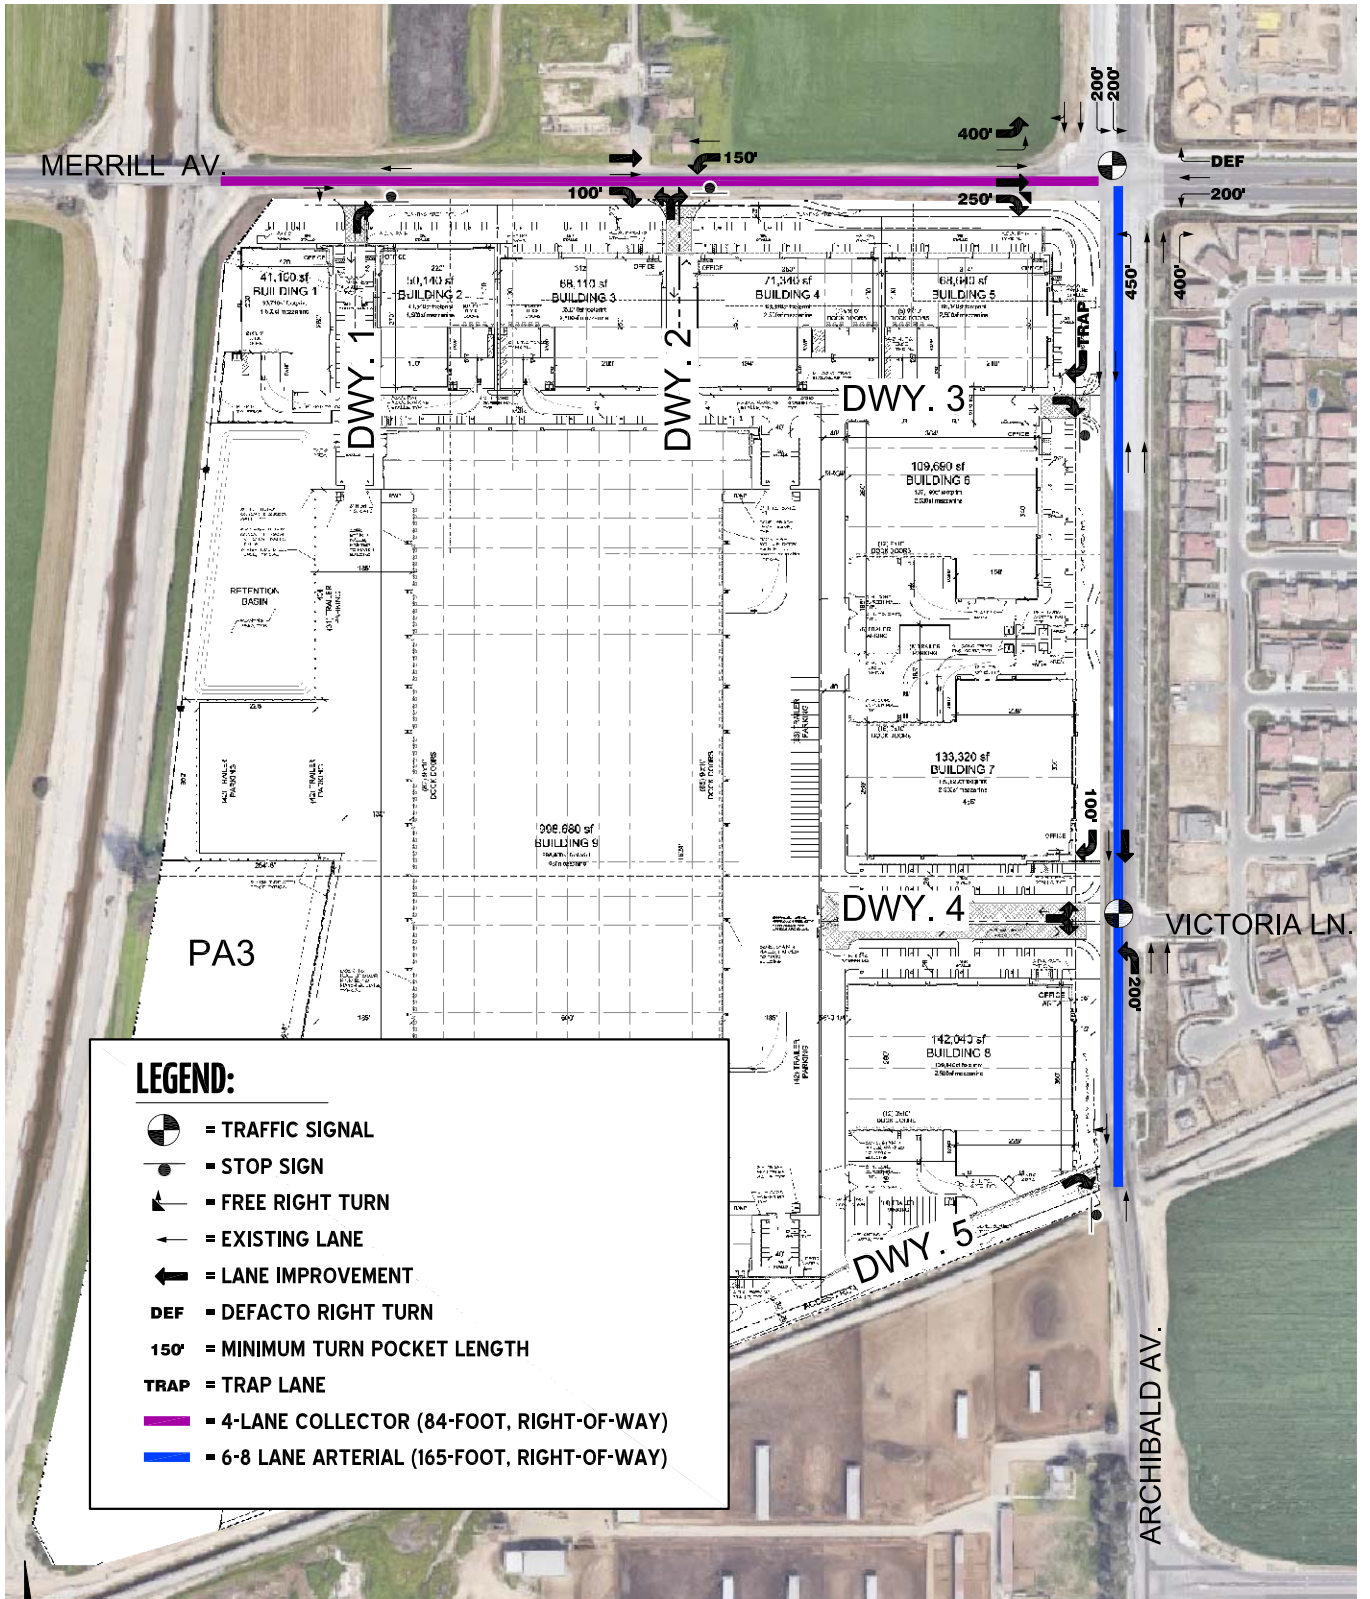

To ensure that this TIA satisfies the City of Ontario's traffic study requirements, Urban Crossroads, Inc. prepared a project traffic study scoping package for review by City staff prior to the preparation of this report. The Agreement provides an outline of the Project study area, trip generation, trip distribution, and analysis methodology. The Agreement approved by the City is included in Appendix 1.1.

1.3.1 INTERSECTIONS

The following 37 study area intersections shown on Exhibit 1-2 and listed in Table 1-1 were selected for this TIA based on consultation with City of Ontario staff. The "50 peak hour trip" criterion utilized by the City of Ontario is consistent with the methodology employed by the County of San Bernardino, and generally represents a minimum number of trips at which a typical intersection would have the potential to be substantively impacted by a given development proposal. Although each intersection may have unique operating characteristics, this traffic engineering rule of thumb is a widely utilized tool for estimating a potential area of impact (i.e., study area). The "50 peak hour trip" criterion is also utilized by the County of Riverside, including the City of Eastvale. Other analysis intersections, within the adjacent cities were not selected for evaluation as the Project is anticipated to contribute less than 50 peak hour trips.

The Project is anticipated to contribute less than 50 peak hour trips to several study area intersections, however, all study area intersections identified in the approved scoping agreement with City of Ontario staff has been evaluated for the purposes of this study.

1.3.2 FREEWAY MAINLINE SEGMENTS

Study area freeway mainline analysis locations were selected based on Caltrans traffic study guidelines, which may require the analysis of State highway facilities. (2) Consistent with recent Caltrans guidance, and because impacts to freeway segments tend to dissipate with distance from the point of State Highway System (SHS) entry, quantitative study of freeway segments beyond those immediately adjacent to the point of entry typically is not required. As such, this study evaluates the following freeway segments adjacent to the point of entry to the SHS, where the Project is anticipated to contribute 25 or more one-way peak hour trips (see Table 1-2):

TABLE 1-2: FREEWAY MAINLINE SEGMENT ANALYSIS LOCATIONS

ID	Freeway Mainline Segments
1	SR-71 Freeway – Southbound, South of Euclid Av. (SR-83)
2	SR-71 Freeway – Northbound, South of Euclid Av. (SR-83)
3	SR-60 Freeway – Westbound, West of Archibald Av.
4	SR-60 Freeway – Westbound, East of Archibald Av.
5	SR-60 Freeway – Eastbound, West of Archibald Av.
6	SR-60 Freeway – Eastbound, East of Archibald Av.
7	I-15 Freeway – Southbound, North of Cantu Galleano Ranch Rd.
8	I-15 Freeway – Southbound, Cantu Galleano Ranch Rd. to Limonite Av.
9	I-15 Freeway – Southbound, South of Limonite Av.
10	I-15 Freeway – Northbound, North of Cantu Galleano Ranch Rd.
11	I-15 Freeway – Northbound, Cantu Galleano Ranch Rd. to Limonite Av.
12	I-15 Freeway – Northbound, South of Limonite Av.

1.3.3 FREEWAY MERGE/DIVERGE RAMP JUNCTIONS

The study area freeway merge/diverge ramp junction analysis locations include the following freeway ramp junctions for each direction of flow as shown on Table 1-3, where the Project is anticipated to contribute 25 or more one-way peak hour trips:

TABLE 1-3: FREEWAY MERGE/DIVERGE RAMP JUNCTION ANALYSIS LOCATIONS

ID	Freeway Merge/Diverge Ramp Junctions
1	SR-71 Freeway – Southbound, Loop On-Ramp at Euclid Av. (SR-83) (Upstream) (Merge)
2	SR-71 Freeway – Southbound, Loop On-Ramp at Euclid Av. (SR-83) (Downstream) (Merge)
3	SR-71 Freeway – Northbound, Off-Ramp at Euclid Av. (SR-83) (Diverge)
4	SR-60 Freeway – Westbound, On-Ramp at Archibald Av. (Merge)
5	SR-60 Freeway – Westbound, Off-Ramp at Archibald Av. (Diverge)
6	SR-60 Freeway – Eastbound, Off-Ramp at Archibald Av. (Diverge)
7	SR-60 Freeway – Eastbound, On-Ramp at Archibald Av. (Merge)
8	I-15 Freeway – Southbound, Off-Ramp at Cantu Galleano Ranch Rd. (Diverge)
9	I-15 Freeway – Southbound, On-Ramp at Limonite Av. (Merge)
10	I-15 Freeway – Northbound, On-Ramp at Cantu Galleano Ranch Rd. (Merge)
11	I-15 Freeway – Northbound, Off-Ramp at Limonite Av. (Diverge)

1.4 PROJECT IMPACTS AND MITIGATION MEASURES

This section provides a summary of recommended mitigation measures necessary to address Project impacts for E+P traffic conditions. Section 2 *Methodologies* provides information on the methodologies used in the analysis and Section 5 *E+P Traffic Analysis* includes the detailed analysis. The recommended mitigation measures necessary to reduce Project impacts to less than significant are discussed in Section 1.4.2. The construction of facilities by the Project applicant would be eligible for DIF credit and reimbursement if the construction exceeds the Project’s fair share. The City shall review the proposed mitigation measures to determine if the Project shall construct certain improvements, including traffic signals or contribute fair share.

1.4.1 PROJECT IMPACTS

Hellman Avenue / Kimball Avenue (#10) – Although this intersection was found to operate at an unacceptable LOS (LOS F) during the peak hours under Existing traffic conditions, the intersection is anticipated to continue to operate at unacceptable levels during the peak hours with the addition of Project traffic. However, the Project is anticipated to contribute less than 50 peak hour trips (City of Chino’s significance criteria) and the delay is anticipated to increase by less than 5.0 seconds (City of Eastvale’s significance criteria). As such, the impact is considered less than significant.

Impact 1.1 – Archibald Avenue / Limonite Avenue (#26) – Although this intersection was found to operate at an unacceptable LOS (LOS E) during the PM peak hour under Existing traffic conditions, the intersection is anticipated to continue to operate at unacceptable levels during the peak hours with the addition of Project traffic. As such, the impact is considered cumulatively significant (Cumulative Impact 1.1).

Impact 2.1 – Hamner Avenue / Ontario Ranch Road (#31) – Although this intersection was found to operate at an unacceptable LOS (LOS F) during the AM and PM peak hours under Existing traffic conditions, the intersection is anticipated to continue to operate at unacceptable levels during

both peak hours with the addition of Project traffic. As such, the impact is considered cumulatively significant (Cumulative Impact 2.1).

1.4.2 MITIGATION MEASURES

Mitigation Measure 1.1 – Archibald Avenue / Limonite Avenue (#26) – The following improvement is necessary to reduce the Project’s proportionate increase in delay to pre-project levels or better, thus reducing the Project’s cumulative impact to less than significant:

- Construct a 2nd southbound left turn lane. The Project should contribute their fair share towards the implementation of this improvement to reduce the Project’s cumulative impact to less than significant.

Mitigation Measure 2.1 – Hamner Avenue / Ontario Ranch Road (#31) – It should be noted that the intersection of Hamner Avenue and Ontario Ranch Road is currently under construction to widen Hamner Avenue between Ontario Ranch Road/Cantu Galleano Ranch Road and Bellegrave Avenue. It is anticipated that once these improvements are completed (mid to late 2017), the intersection would operate at acceptable LOS during the peak hours and the Project’s cumulative impact at the intersection would be less than significant.

1.5 LOCAL AND REGIONAL FUNDING MECHANISMS

Transportation improvements within the City of Ontario are funded through a combination of direct project mitigation, development impact fee programs or fair share contributions, such as the City of Ontario Development Impact Fee (DIF) program. Identification and timing of needed improvements is generally determined through local jurisdictions based upon a variety of factors.

Table 1-4 lists the incremental intersection improvements that are required for each analysis scenario from Existing and Horizon Year (2040) traffic conditions to alleviate circulation system deficiencies. Similarly, Table 1-5 lists the incremental roadway segment improvements. The regional and local transportation impact fee programs have each been reviewed and compared to the recommended improvements for each impacted facility. Recommended improvements already identified and included in the City of Ontario DIF are clearly denoted. If an impacted facility was found to require improvements beyond those already identified within the fee program, the Project would be required to contribute the associated intersection or roadway fair-share percentage toward the costs of the recommended improvements. The fair-share calculations, presented on Table 1-4, indicate that the Project contributes 0.9% to 18.9% of new vehicle trips to these intersections. The construction of facilities by the Project Applicant would be eligible for DIF credit and reimbursement if the construction exceeds the Project’s fair share, as identified in Table 1-4.

								Total	\$111,300		\$4,767	
Total Costs for Horizon Year (2040) Improvements									\$17,954,700		\$1,100,946	
Total Project Fair Share Contribution to the City of Ontario (non-DIF/other)⁹									\$60,749			
Total Project Fair Share Contribution to the City of Chino¹⁰									\$193,408			
Total Project Fair Share Contribution to the City of Eastvale¹¹									\$164,728			
Total Project Fair Share Contribution to Caltrans¹²									\$35,922			

¹ Improvements included in City of Ontario DIF program for local, regional and specific plan components.

² Costs have been estimated using the data provided in Appendix "G" of the CMP (2003 Update) for preliminary construction costs.

³ Appendix "G" costs escalated by a factor of 1.484 except Traffic Signals to reflect current costs.

⁴ Program improvements constructed by project may be eligible for fee credit, at discretion of City. See Table 1-5 for Fair Share Calculations.

⁵ Rough order of magnitude cost estimate.

⁶ Improvements are to be constructed by other projects since these improvements are needed for site access.

⁷ Improvements are currently under construction.

⁸ Interchange redesign includes widening the bridge over the I-15 Freeway to three lanes in each direction with loop on-ramps, eliminating the left turns onto the on-ramps.

⁹ The project fair share contribution for those improvements already included in a pre-existing fee program has been provided for comparison purposes. Project would not pay this fair share amount, but would instead contribute their fair share towards these improvements through their payment of fees.

¹⁰ Total project fair share contribution consists of the improvements which are not already included in the City-wide DIF for those intersections wholly or partially within the City of Ontario.

¹¹ Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the City of Chino.

¹² Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the City of Chino Hills.

¹³ Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the City of Eastvale.

¹⁴ Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within Caltrans' jurisdiction.

¹⁵ If improvements are not fully covered by an applicable pre-existing fee program, then the intersection has been identified to have a significant impact even after mitigation measures are implemented. However, if the improvements in a pre-existing fee program are fully funded by the pre-existing fee program, then the intersection is found to have no significant impact after the implementation of the mitigation measures.

¹⁶ Fair share not applicable as these improvements would be constructed by the Project as part of the site adjacent improvements.

⁵ Rough order of magnitude cost estimate.

⁶ Improvements are to be constructed by other projects since these improvements are needed for site access.

⁷ Improvements are currently under construction.

⁸ Interchange redesign includes widening the bridge over the I-15 Freeway to three lanes in each direction with loop on-ramps, eliminating the left turns onto the on-ramps.

⁹ The project fair share contribution for those improvements already included in a pre-existing fee program has been provided for comparison purposes. Project would not pay this fair share amount, but would instead contribute their fair share towards these improvements through their payment of fees.

⁹ Total project fair share contribution consists of the improvements which are not already included in the City-wide DIF for those intersections wholly or partially within the City of Ontario.

¹⁰ Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the City of Chino.

¹¹ If improvements are not fully covered by an applicable pre-existing fee program, then the intersection has been identified to have a significant impact even after mitigation measures are implemented. However, if the improvements in a pre-existing fee program are fully funded by the pre-existing fee program, then the intersection is found to have no significant impact after the implementation of the mitigation measures.

This Page Intentionally Left Blank

The improvements listed in Table 1-4 comprise lane additions/modifications, installation of signals and signal modifications. As noted, the identified improvements are covered either by the City of Ontario DIF Program or as a fair-share contribution, if not covered by a fee program. Depending on the width of the existing pavement and right-of-way, these improvements may involve only striping modifications or they may involve construction of additional pavement width. Additional discussion of the relevant pre-existing transportation impact fee programs is provided below.

1.5.1 CITY OF ONTARIO DEVELOPMENT IMPACT FEE PROGRAM

The City of Ontario has created its own local DIF program to impose and collect fees from new residential, commercial and industrial development for the purpose of funding roadways and intersections necessary to accommodate City growth as identified in the City's General Plan Circulation Element. The City's DIF includes regional improvements to comply with Measure "I." The fee schedule was last updated in April 6, 2015 and is reviewed/adjusted annually based upon changes in the construction cost index (CCI). Under the City's DIF program, the City may grant to developers a credit against specific components of fees when those developers construct certain facilities and landscaped medians identified in the list of improvements funded by the DIF program.

The timing to use the DIF fees is established through periodic capital improvement programs which are overseen by the City's Public Works Department. Periodic traffic counts, review of traffic accidents, and a review of traffic trends throughout the City are also periodically performed by City staff and consultants. The City uses this data to determine the timing of implementing the improvements listed in its facilities list. The City also uses this data to ensure that the improvements listed on the facilities list are constructed before the LOS falls below the LOS performance standards adopted by the City. In this way, the improvements are constructed before the LOS falls below the City's LOS performance thresholds.

The Project applicant will be subject to the City's DIF fee program, and will pay the requisite City DIF fees at the rates then in effect pursuant to the City's ordinance. The Project Applicant's payment of the requisite DIF at the rates then in effect, pursuant to the City DIF Program, would satisfy the Project's proportional mitigation requirements at potentially affected DIF-funded facilities.

1.5.2 MEASURE "I" FUNDS

In 2004, the voters of San Bernardino County approved the 30-year extension of Measure "I," a one-half of one percent sales tax on retail transactions, through the year 2040, for transportation projects including, but not limited to, infrastructure improvements, commuter rail, public transit, and other identified improvements. The Measure "I" extension requires that a regional traffic impact fee be created to ensure development is paying its fair share. A regional Nexus study was prepared by SBCTA and concluded that each jurisdiction should include a regional fee component in their local programs in order to meet the Measure "I" requirement. The regional component assigns specific facilities and cost sharing formulas to each jurisdiction and was most recently updated in November 2011. Revenues collected through these programs are used in tandem

with Measure “I” funds to deliver projects identified in the Nexus Study. While Measure “I” is a self-executing sales tax administered by SBCTA, it bears discussion here because the funds raised through Measure “I” have funded in the past and will continue to fund new transportation facilities in San Bernardino County.

1.5.3 FAIR SHARE CONTRIBUTION

Project mitigation may include a combination of fee payments to established programs, construction of specific improvements, payment of a fair share contribution toward future improvements or a combination of these approaches. Improvements constructed by development may be eligible for a fee credit or reimbursement through the program where appropriate (to be determined at the City’s discretion).

When off-site improvements are identified with a minor share of responsibility assigned to proposed development, the approving jurisdiction may elect to collect a fair share contribution or require the development to construct improvements. Detailed fair share calculations, for each peak hour, have been provided on Table 1-6 for the deficient intersections shown previously on Table 1-4 and on Table 1-7 for the deficient roadway segments previously shown on Table 1-5.

Improvements included in a defined program and constructed by development may be eligible for a fee credit or reimbursement through the program where appropriate. A rough order of magnitude cost has been prepared to determine the appropriate contribution value based upon the project’s fair share of traffic as part of the project approval process. Table 1-4 and Table 1-5 also summarize the applicable cost associated with each of the recommended improvements based on the preliminary construction cost estimates found in Appendix G of the San Bernardino County CMP in conjunction with a cost escalation factor of 1.484 to reflect current (2017) costs. The total cost of needed study area intersection improvements is \$17,954,700 and \$2,665,678 for study area roadway segments. Based on the Project fair share percentages shown on Table 1-6 and Table 1-7, the Project’s fair share cost is estimated at \$1,100,946 for the study area intersections and \$156,851 for the study area roadway segments. These estimates are a rough order of magnitude only as they are intended only for discussion purposes and do not imply any legal responsibility or formula for contributions or mitigation.

1.6 CUMULATIVE IMPACTS

A summary of the cumulatively impacted study area intersections and recommended mitigation measures to address cumulatively significant impacts are described in detail within Section 6 *Opening Year Cumulative (2019) Traffic Conditions* and Section 7 *Horizon Year (2040) Traffic Conditions*. Cumulative impacts are deficiencies that would not be directly caused by the Project. The Project would, however, contribute traffic to these deficient facilities along with other cumulative development projects, resulting in a cumulatively considerable impact.

The following mitigation measures are based on the improvements needed under Horizon Year (2040) traffic conditions. The improvements needed to address Opening Year Cumulative deficiencies would be a sub-set of those improvements recommended under Horizon Year (2040) traffic conditions.

1.6.1 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES AT INTERSECTIONS

A summary of off-site improvements needed to address cumulative traffic impacts for Horizon Year (2040) traffic conditions was included in Table 1-4. Improvements found to be included in City of Ontario (lead agency) DIF program have been identified as such. For improvements that do not appear to be in the City's DIF program, a fair share financial contribution based on the Project's fair share impact shall be imposed (for City of Ontario facilities) and may be imposed by other jurisdictions in order to mitigate the Project's share of impacts in lieu of construction. These fees (both to the City of Ontario, and as determined, to surrounding agencies as fair-share contributions) are collected as part of a funding mechanism aimed at ensuring that regional highways and arterial expansions keep pace with the projected vehicle trip increases.

A rough order of magnitude cost has been prepared to determine the appropriate contribution value based upon the Project's fair share of traffic as part of the project approval process. Based on the Project fair share percentages, the Project's fair share cost is estimated at \$1,836,745. Table 1-4 shows the Project's fair share cost for Horizon Year (2040) traffic conditions. These estimates are a rough order of magnitude only as they are intended only for discussion purposes and do not imply any legal responsibility or formula for contributions or mitigation.

1.6.2 CUMULATIVE MITIGATION MEASURES

Mitigation Measure 3.1 – Prior to the issuance of building permits, the Project applicant shall participate in the City's DIF program by paying the requisite DIF fee at the time of building permit; and in addition, shall pay the Project's fair share amount of \$60,749 for the improvements identified in Table 1-4 that are consistent with the improvements shown on Table 7-6, or as agreed to by the City and Project Applicant.

Mitigation Measure 4.1 – Table 1-4 of the TIA includes intersections that either share a mutual border with the City of Chino or are wholly located within the City of Chino that have recommended improvements which are not covered by DIF. Because the City of Ontario does not have plenary control over intersections that share a border with the City of Chino, the City cannot guarantee that such improvements will be constructed. Thus, the following additional mitigation measure is required: The City of Ontario shall participate in a multi-jurisdictional effort

with the City of Chino to develop a study to identify fair share contribution funding sources attributable to and paid from private and public development to supplement other regional and State funding sources necessary to implement the improvements identified in Table 1-4 of the TIA, that are located in the City of Chino. The study shall include fair-share contributions related to private and or public development based on nexus requirements contained in the Mitigation Fee Act (Govt. Code § 66000 et seq.) and 14 Cal. Code of Regs. § 15126.4(a)(4) and, to this end, the study shall recognize that impacts attributable to City of Chino facilities that are not attributable to development located within the City of Ontario are not paying in excess of such developments' fair share obligations. The fee study shall also be compliant with Government Code § 66001(g) and any other applicable provisions of law. The study shall set forth a timeline and other agreed-upon relevant criteria for implementation of the recommendations contained within the study to the extent the other agencies agree to participate in the fee study program. Because the City of Ontario and the City of Chino are responsible to implement this mitigation measure, Developer shall have no compliance obligations with respect to this Mitigation Measure.

Mitigation Measure 4.2 – The Developer's fair-share amount for the intersections that either share a mutual border with the City of Chino or are wholly located within the City of Chino that have recommended improvements for Project Buildout which are not covered by DIF equals \$193,408. Developer shall be required to pay this \$193,408 amount to the City of Ontario prior to the issuance of the Project's final certificate of occupancy. The City of Ontario shall hold Developer's Fair Share contribution in trust and shall apply Developer's Fair Share Contribution to any fee program adopted or agreed upon by the City of Ontario and City of Chino as a result of implementation of Mitigation Measure 4.1. If, within five years of the date of collection of Developer's Fair Share Contribution, the City of Ontario and City of Chino do not comply with Mitigation Measure 4.1, then Developer's Fair Share Contribution shall be returned to the Developer.

Mitigation Measure 5.1 – Table 1-4 of the TIA includes intersections that either shares a mutual border with the City of Eastvale or are wholly located within the City of Eastvale that have a recommended improvement which is not covered by DIF. Because the City of Ontario does not have plenary control over intersections that share a border with the City of Eastvale, the City cannot guarantee that such improvements will be constructed. Thus, the following additional mitigation measure is required: The City of Ontario shall participate in a multi-jurisdictional effort with the City of Eastvale to develop a study to identify fair share contribution funding sources attributable to and paid from private and public development to supplement other regional and State funding sources necessary to implement the improvements identified in Table 1-4 of the TIA, that are located in the City of Eastvale. The study shall include fair-share contributions related to private and or public development based on nexus requirements contained in the Mitigation Fee Act (Govt. Code § 66000 et seq.) and 14 Cal. Code of Regs. § 15126.4(a)(4) and, to this end, the study shall recognize that impacts attributable to City of Eastvale facilities that are not attributable to development located within the City of Ontario are not paying in excess of such developments' fair share obligations. The fee study shall also be compliant with Government Code § 66001(g) and any other applicable provisions of law. The study shall set forth a timeline and other agreed-upon relevant criteria for implementation of the

recommendations contained within the study to the extent the other agencies agree to participate in the fee study program. Because the City of Ontario and the City of Eastvale are responsible to implement this mitigation measure, Developer shall have no compliance obligations with respect to this Mitigation Measure.

Mitigation Measure 5.2 – The Developer’s fair-share amount for the intersections that either shares a mutual border with the City of Eastvale or are wholly located within the City of Eastvale that have recommended improvements for Project Buildout which is not covered by DIF equals \$164,728. Developer shall be required to pay this \$164,728 amount to the City of Ontario prior to the issuance of the Project's final certificate of occupancy. The City of Ontario shall hold Developer’s Fair Share contribution in trust and shall apply Developer’s Fair Share Contribution to any fee program adopted or agreed upon by the City of Ontario and City of Eastvale as a result of implementation of Mitigation Measure 5.1. If, within five years of the date of collection of Developer’s Fair Share Contribution, the City of Ontario and City of Eastvale do not comply with Mitigation Measure 5.1, then Developer’s Fair Share Contribution shall be returned to the Developer.

Mitigation Measure 6.1 – Table 1-4 of the TIA includes intersections that either share a mutual border with Caltrans’ jurisdiction or are wholly located within Caltrans’ jurisdiction and have recommended improvements which are not covered by payment of fees. Because the City of Ontario does not have plenary control over the freeway on and off ramps that lie within Caltrans’ jurisdiction, the City cannot guarantee that such improvements will be constructed. Thus, the following additional mitigation measure is required: The City of Ontario shall participate in a multi-jurisdictional effort with Caltrans to develop a study to identify fair share contribution funding sources attributable to and paid from private and public development to supplement other regional and State funding sources necessary to implement the improvements identified in Table 1-4 of the TIA, that are located in Caltrans’ jurisdiction. The study shall include fair-share contributions related to private and or public development based on nexus requirements contained in the Mitigation Fee Act (Govt. Code § 66000 et seq.) and 14 Cal. Code of Regs. § 15126.4(a)(4) and, to this end, the study shall recognize that impacts attributable to Caltrans facilities that are not attributable to development located within the City of Ontario are not paying in excess of such developments’ fair share obligations. The fee study shall also be compliant with Government Code § 66001(g) and any other applicable provisions of law. The study shall set forth a timeline and other agreed-upon relevant criteria for implementation of the recommendations contained within the study to the extent the other agencies agree to participate in the fee study program. Because the City of Ontario and Caltrans are responsible to implement this mitigation measure, Developer shall have no compliance obligations with respect to this Mitigation Measure.

Mitigation Measure 6.2 – The Developer’s fair-share amount for the intersections that either share a mutual border with Caltrans or are wholly located within Caltrans’ jurisdiction that have recommended improvements for Project Buildout which are not covered by payment of fees equals \$35,922. Developer shall be required to pay this \$35,922 amount to the City of Ontario prior to the issuance of the Project's final certificate of occupancy. The City of Ontario shall hold Developer’s Fair Share contribution in trust and shall apply Developer’s Fair Share Contribution

to any fee program adopted or agreed upon by the City of Ontario and Caltrans as a result of implementation of Mitigation Measure 6.1. If, within five years of the date of collection of Developer's Fair Share Contribution, the City of Ontario and Caltrans do not comply with Mitigation Measure 6.1, then Developer's Fair Share Contribution shall be returned to the Developer.

1.7 ON-SITE ROADWAY AND SITE ACCESS IMPROVEMENTS

This section summarizes Project site access and on-site circulation recommendations. The Project is proposed to have access on Merrill Avenue and Archibald Avenue via the following driveways:

- Driveway 1 / Merrill Avenue – Right-in/right-out driveway providing access to both passenger cars and trucks.
- Driveway 2 / Merrill Avenue – Full access driveway providing access to both passenger cars and trucks. This driveway is proposed to be signalized and would provide access to the future development on the northwest corner of Archibald Avenue and Merrill Avenue.
- Archibald Avenue / Driveway 3 – Right-in/right-out driveway providing access to both passenger cars and trucks.
- Archibald Avenue / Driveway 4 – Full access driveway providing access to both passenger cars and trucks. This driveway is proposed to be signalized and would provide access to the existing residential development on the southeast corner of Archibald Avenue and Merrill Avenue.
- Archibald Avenue / Driveway 5 – Right-in/right-out driveway providing access to both passenger cars and trucks.

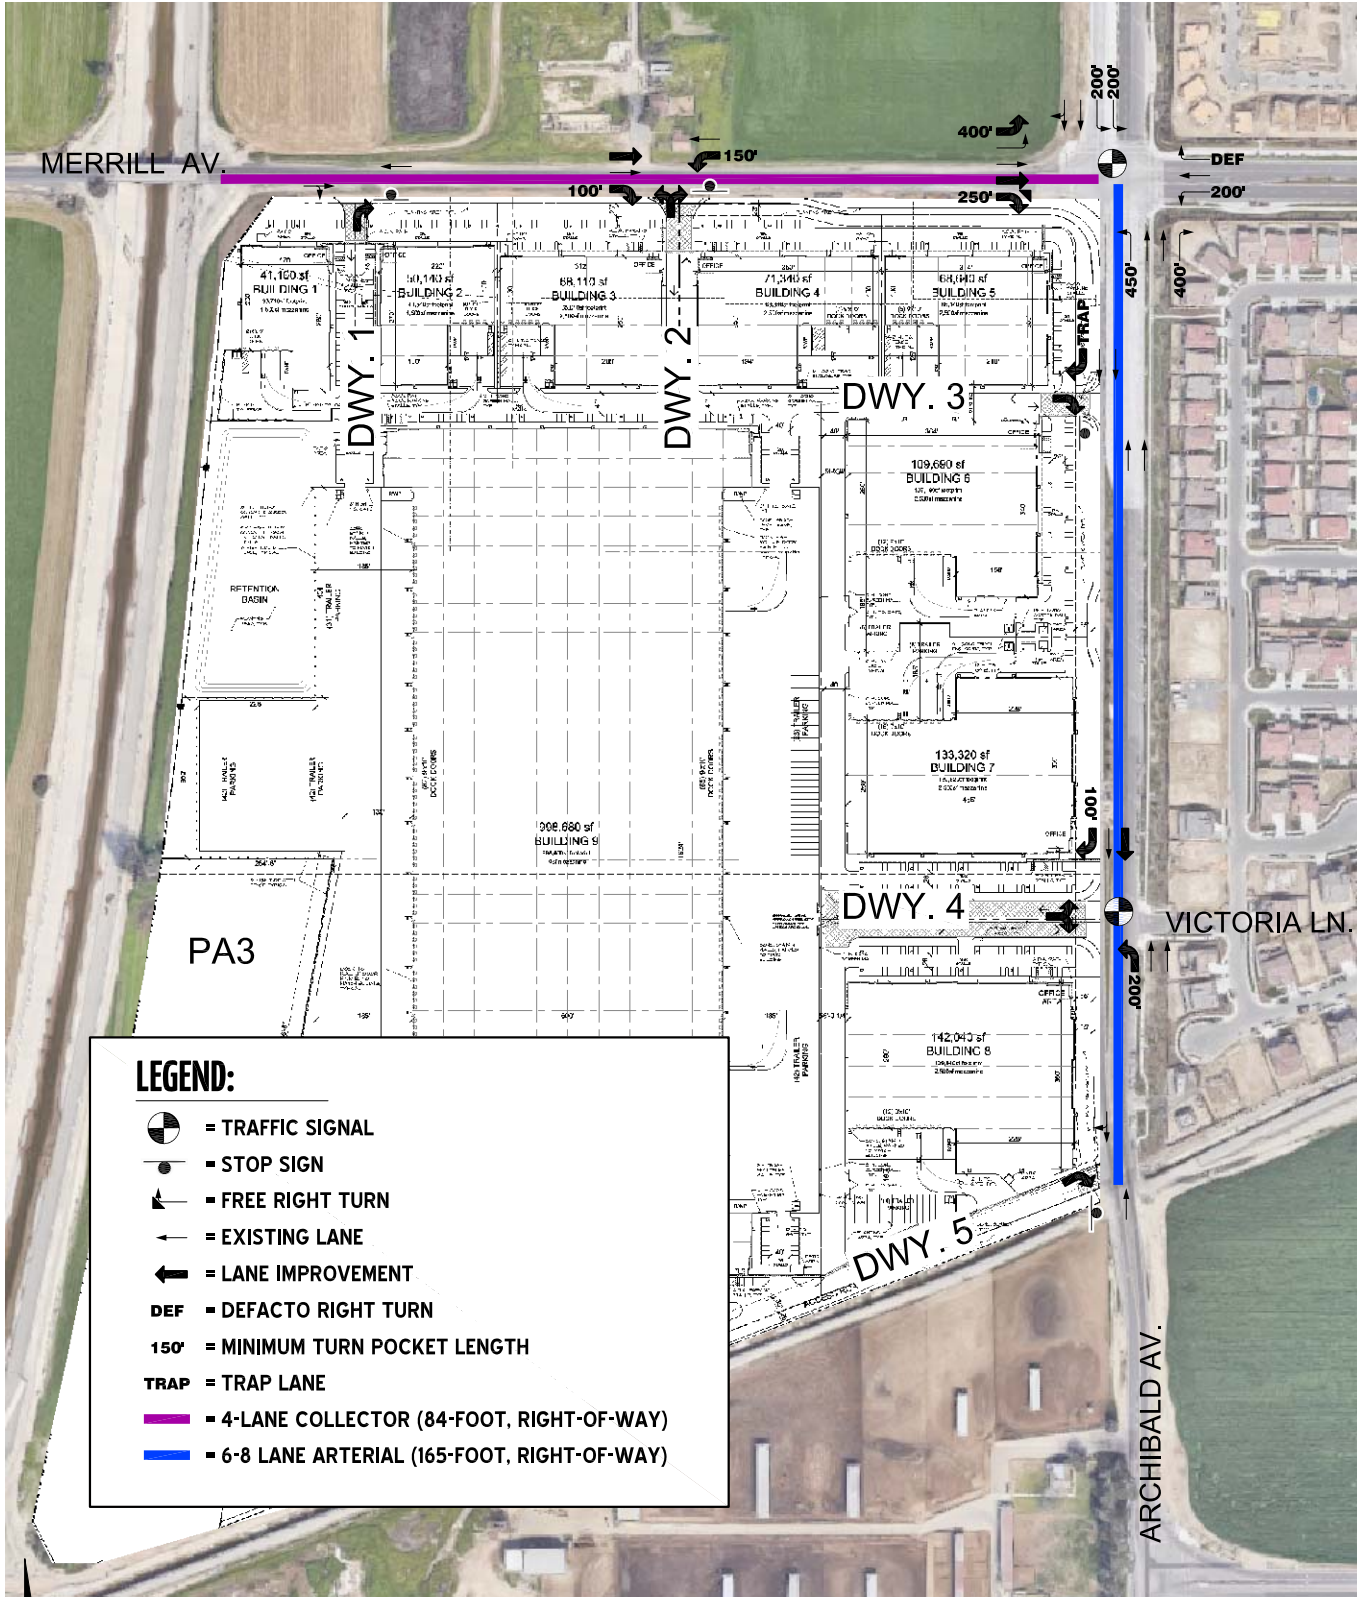

Regional access to the Project site is provided via the SR-60 Freeway at Archibald Avenue, the SR-71 Freeway at Euclid Avenue (SR-83), and the I-15 Freeway at Cantu Galleano Ranch Road and Limonite Avenue interchanges. Roadway improvements necessary to provide site access and on-site circulation are assumed to be constructed in conjunction with site development and are described below. These improvements are required to be in place prior to occupancy.

1.7.1 SITE ADJACENT ROADWAY AND SITE ACCESS IMPROVEMENTS

The recommended site-adjacent roadway improvements for the Project are described below. These improvements need to be incorporated into the Project description prior to Project approval or imposed as conditions of approval as part of the Project approval. Exhibit 1-3 illustrates the site-adjacent roadway improvement recommendations.

Exhibit 1-3 also illustrates the on-site and site adjacent recommended roadway lane improvements for the Project under near term traffic conditions. Construction of on-site and site adjacent improvements are recommended to occur in conjunction with adjacent Project development activity or as needed for Project access purposes. Ultimate improvements along Merrill Avenue and Archibald Avenue are consistent with the City of Ontario General Plan.

EXHIBIT 1-3: SITE ACCESS AND SITE ADJACENT ROADWAY RECOMMENDATIONS

LEGEND:

- = TRAFFIC SIGNAL
- = STOP SIGN
- = FREE RIGHT TURN
- = EXISTING LANE
- = LANE IMPROVEMENT
- DEF** = DEFACTO RIGHT TURN
- 150'** = MINIMUM TURN POCKET LENGTH
- TRAP** = TRAP LANE
- = 4-LANE COLLECTOR (84-FOOT, RIGHT-OF-WAY)
- = 6-8 LANE ARTERIAL (165-FOOT, RIGHT-OF-WAY)

Merrill Avenue – Merrill Avenue is an east-west oriented roadway located along the Project’s northern boundary. Construct Merrill Avenue from the western Project boundary to Archibald Avenue at its ultimate half-section width as a 4-lane Collector (ultimate 84-foot right-of-way), consistent with the City of Ontario’s General Plan. The roadway is proposed to have two travel lane in each direction, with an ultimate curb-to-curb width of 64 feet.

Archibald Avenue – Archibald Avenue is a north-south oriented roadway located along the eastern boundary of the Project. Construct Archibald Avenue from Merrill Avenue to the Project’s southern boundary at its ultimate half-section width as a 6-lane Principal Arterial (ultimate 165-foot or more right-of-way) in compliance with the circulation recommendations found in the City of Ontario’s General Plan. The cross-section includes an ultimate curb-to-curb width of 94-feet with three travel lanes in each direction.

Wherever necessary, roadways adjacent to the Project, site access points and site-adjacent intersections will be constructed to be consistent with the identified roadway classifications and respective cross-sections in the City of Ontario General Plan Circulation Element.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the Project site.

Sight distance at each project access point should be reviewed with respect to standard Caltrans and City of Ontario sight distance standards at the time of preparation of final grading, landscape and street improvement plans.

1.7.2 QUEUING ANALYSIS AT THE PROJECT DRIVEWAYS

A queuing analysis was conducted along the site adjacent roadways of Merrill Avenue and Archibald Avenue for Horizon Year (2040) traffic conditions to determine the turn pocket lengths necessary to accommodate near term 95th percentile queues. The analysis was conducted for both the weekday AM and weekday PM peak hours.

The traffic modeling and signal timing optimization software package Synchro (Version 9) has been utilized to assess queues at the Project access points. Synchro is a macroscopic traffic software program that is based on the signalized and unsignalized intersection capacity analyses as specified in the HCM. Macroscopic level models represent traffic in terms of aggregate measures for each movement at the study intersections. Equations are used to determine measures of effectiveness such as delay and queue length in Synchro. The LOS and capacity analysis performed by Synchro takes into consideration optimization and coordination of signalized intersections within a network.

SimTraffic is designed to model networks of signalized and unsignalized intersections, with the primary purpose of checking and fine-tuning signal operations. SimTraffic uses the input parameters from Synchro to generate random simulations. The 95th percentile queue is not necessarily ever observed; it is simply based on statistical calculations (or Average Queue plus 1.65 standard deviations). However, the average queue is the average of all the two-minute maximum queues observed by SimTraffic. The maximum back of queue observed for every two-minute period is recorded by SimTraffic.

SimTraffic has been utilized to assess peak hour queuing at the site access driveways for Horizon Year (2040) With Project traffic conditions. The random simulations generated by SimTraffic have been utilized to determine the 50th and 95th percentile queue lengths observed for each turn lane. A SimTraffic simulation has been recorded five (5) times, during the weekday AM and weekday PM peak hours, and has been seeded for 60-minute periods with 60-minute recording intervals.

A vehicle is considered queued whenever it is traveling at less than 10 feet/second. A vehicle will only become queued when it is either at the stop bar or behind another queued vehicle. Although only the 95th percentile queue has been utilized for purposes of determining the necessary turn pocket storage lengths, the 50th percentile queues are also reported. The 50th percentile queue is the maximum back of queue on a typical cycle during the peak hour, while the 95th percentile queue is the maximum back of queue with 95th percentile traffic volumes during the peak hour. In other words, if traffic were observed for 100 cycles, the 95th percentile queue would be the queue experienced with the 95th busiest cycle (or 5% of the time).

The storage length recommendations for the turning movements at the Project were shown previously on Exhibit 1-3. A summary of the queuing results are also shown on Table 1-8. The Horizon Year (2040) queuing results are provided in Appendix 1.2 of this report.

1.8 PEDESTRIAN AND BICYCLE ACCOMMODATIONS

1.8.1 PEDESTRIAN ACCOMMODATIONS

The Project will construct its ultimate half-section of Merrill Avenue and Archibald Avenue including curb and gutter and sidewalk improvements.

1.8.2 BICYCLE ACCOMMODATIONS

Consistent with the City of Ontario General Plan, Merrill Avenue is proposed to have a Class II bikeway and multipurpose trail in the vicinity of the Project. The Cucamonga Creek Multipurpose Trail runs along the Project's western boundary.

1.9 TRUCK ACCESS AND CIRCULATION

Due to the typical wide turning radius of large trucks, a truck turning template has been overlaid on the site plan at each applicable Project driveway and site adjacent intersection anticipated to be utilized by heavy trucks in order to determine appropriate curb radii and to verify that trucks will have sufficient space to execute turning maneuvers (see Exhibit 1-4). As shown, the Project driveways and site adjacent intersections are anticipated to accommodate the wide turning radius of the heavy trucks, with the exception of Driveways 1, 3, and 5. As shown on Exhibit 1-4, Driveway 1 should be modified to provide a 70-foot radius on the southwest curb, Driveway 3 should be modified to provide a 35-foot radius on the northwest curb, and Driveway 5 should be modified to provide a 50-foot radius on the northwest curb and a 25-foot radius on the southwest curb in order to accommodate the wide turning radius of a heavy truck. A WB-67 truck (53-foot trailer) has been utilized for the purposes of this analysis.

Table 1-8

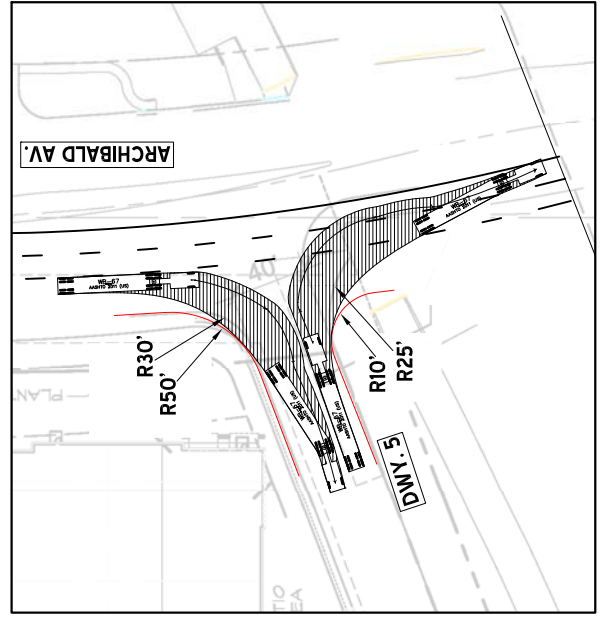

Peak Hour Queuing Summary for Site Adjacent Intersections - Horizon Year (2040) With Project Conditions

Intersection	Movement	Available Stacking Distance (Feet)	95th Percentile Queue (Feet) ³		Acceptable? ¹

¹ Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

² 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

2 METHODOLOGIES

This section of the report presents the methodologies used to perform the traffic analyses summarized in this report. The methodologies described are generally consistent with City of Ontario traffic study guidelines.

2.1 LEVEL OF SERVICE

Traffic operations of roadway facilities are described using the term "Level of Service" (LOS). LOS is a qualitative description of traffic flow based on several factors such as speed, travel time, delay, and freedom to maneuver. Six levels are typically defined ranging from LOS A, representing completely free-flow conditions, to LOS F, representing breakdown in flow resulting in stop-and-go conditions. LOS E represents operations at or near capacity, an unstable level where vehicles are operating with the minimum spacing for maintaining uniform flow.

2.2 INTERSECTION CAPACITY ANALYSIS

The definitions of LOS for interrupted traffic flow (flow restrained by the existence of traffic signals and other traffic control devices) differ slightly depending on the type of traffic control. The LOS is typically dependent on the quality of traffic flow at the intersections along a roadway. The *Highway Capacity Manual* (HCM) methodology expresses the LOS at an intersection in terms of delay time for the various intersection approaches. (4) The HCM uses different procedures depending on the type of intersection control.

2.2.1 SIGNALIZED INTERSECTIONS

City of Ontario, City of Chino, City of Eastvale, City of Jurupa Valley

The City of Ontario, City of Chino, City of Eastvale, and City of Jurupa Valley require signalized intersection operations analysis based on the methodology described in the HCM. (4) Intersection LOS operations are based on an intersection's average control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For signalized intersections LOS is directly related to the average control delay per vehicle and is correlated to a LOS designation as described in Table 2-1.

TABLE 2-1: SIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Operations with very low delay occurring with favorable progression and/or short cycle length.	0 to 10.00	A	F
Operations with low delay occurring with good progression and/or short cycle lengths.	10.01 to 20.00	B	F
Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.01 to 35.00	C	F
Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.01 to 55.00	D	F
Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.01 to 80.00	E	F
Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths.	80.01 and up	F	F

Source: HCM 2010

Consistent with Appendix B of the San Bernardino County CMP, the following saturation flow rates, in vehicles per hour green per hour (vphgph), will be utilized in the traffic analysis for signalized intersections:

Existing and Opening Year Cumulative Traffic Conditions:

- Exclusive through: 1800 vphgph
- Exclusive left: 1700 vphgph
- Exclusive right: 1800 vphgpl
- Exclusive dual left: 1600 vphgph
- Exclusive triple left: 1500 vphgph

Horizon Year (2040) Traffic Conditions:

- Exclusive through: 1900 vphgpl
- Exclusive left: 1800 vphgpl
- Exclusive dual left: 1700 vphgpl
- Exclusive right: 1900 vphgpl
- Exclusive dual right: 1800 vphgpl
- Exclusive triple left: 1600 vphgpl or less

The traffic modeling and signal timing optimization software package Synchro (Version 9) has been utilized to analyze signalized intersections within the City of Ontario, City of Chino, City of Eastvale, and City of Jurupa Valley. Synchro is a macroscopic traffic software program that is based on the signalized intersection capacity analysis as specified in the HCM. Macroscopic level models represent traffic in terms of aggregate measures for each movement at the study intersections. Equations are used to determine measures of effectiveness such as delay and queue length. The level of service and capacity analysis performed by Synchro takes into consideration optimization and coordination of signalized intersections within a network.

The peak hour traffic volumes have been adjusted using a peak hour factor (PHF) to reflect peak 15 minute volumes. Common practice for LOS analysis is to use a peak 15-minute rate of flow. However, flow rates are typically expressed in vehicles per hour. The PHF is the relationship between the peak 15-minute flow rate and the full hourly volume (e.g. $PHF = [Hourly\ Volume] / [4 \times Peak\ 15\text{-minute}\ Flow\ Rate]$). The use of a 15-minute PHF produces a more detailed analysis as compared to analyzing vehicles per hour. Existing PHFs have been used for all analysis scenarios. Per the HCM, PHF values over 0.95 often are indicative of high traffic volumes with capacity constraints on peak hour flows while lower PHF values are indicative of greater variability of flow during the peak hour. (4)

California Department of Transportation (Caltrans)

Per the Caltrans *Guide for the Preparation of Traffic Impact Studies*, the traffic modeling and signal timing optimization software package Synchro (Version 9) has also been utilized to analyze signalized intersections under Caltrans' jurisdiction, which include interchange to arterial ramps (i.e. SR-71 Freeway ramp at Euclid Avenue (SR-83), SR-60 Freeway ramps at Archibald Avenue, and I-15 Freeway ramps at Cantu Galleano Ranch Road and Limonite Avenue). (2) Signal timing for the freeway arterial-to-ramp intersections have been obtained from Caltrans District 8 and were utilized for the purposes of this analysis.

2.2.2 UNSIGNALIZED INTERSECTIONS

The City of Ontario, City of Chino, City of Eastvale, and City of Jurupa Valley require the operations of unsignalized intersections be evaluated using the methodology described in the HCM. (4) The LOS rating is based on the weighted average control delay expressed in seconds per vehicle (see Table 2-2).

TABLE 2-2: UNSIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay Per Vehicle (Seconds)	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Little or no delays.	0 to 10.00	A	F
Short traffic delays.	10.01 to 15.00	B	F
Average traffic delays.	15.01 to 25.00	C	F
Long traffic delays.	25.01 to 35.00	D	F
Very long traffic delays.	35.01 to 50.00	E	F
Extreme traffic delays with intersection capacity exceeded.	> 50.00	F	F

Source: HCM 2010

At two-way or side-street stop-controlled intersections, LOS is calculated for each controlled movement and for the left turn movement from the major street, as well as for the intersection as a whole. For approaches composed of a single lane, the delay is computed as the average of all movements in that lane. For all-way stop controlled intersections, LOS is computed for the intersection as a whole.

2.3 ROADWAY SEGMENT CAPACITY ANALYSIS

Roadway segment operations have been evaluated using the City of Ontario Roadway Capacity Values provided in the *City of Ontario General Plan (1992) Infrastructure Element, Figure INF-2 and Table INF-1*. (5) Per the City of Ontario's TIA guidelines, roadway segments within the study area should maintain LOS D capacities on City roadways. The daily roadway segment capacities for each type of roadway are summarized in Table 2-3. As noted in the City of Ontario's General Plan, these roadway capacities are "rule of thumb" estimates for planning purposes and are affected by such factors as intersections (spacing, configuration and control features), degree of access control, roadway grades, design geometrics (horizontal and vertical alignment standards), sight distance, vehicle mix (truck and bus traffic) and pedestrian bicycle traffic. In other words, while using average daily traffic (ADT) for planning purposes is suitable with regards to evaluating potential volume to capacity with future forecasts, it is not suitable for operational analysis because it does not account for the factors listed previously. As such, where the ADT based roadway segment analysis indicates a deficiency (unacceptable LOS), a review of the more detailed peak hour intersection analysis and progression analysis are undertaken. The more detailed peak hour intersection analysis explicitly accounts for factors that affect roadway capacity. Therefore, roadway segment widening is typically only recommended if the peak hour intersection analysis indicates the need for additional through lanes.

TABLE 2-3: ROADWAY SEGMENT CAPACITY LOS THRESHOLDS¹

Street Classification	Lanes	Right of Way Width ²	Curb-to-Curb Width ²	Median ³	LOS E Capacity
Divided Arterial	8	146	120	Yes	65,000
Divided Arterial	6	120 or more	94	Yes	49,000
Standard Arterial	4	100	76	TWLTL ⁴	33,000
Collector Street	4	88	64	No	22,000
Local Street	2	66 / 60	40	No	12,500
Local Industrial Street	2	66	48	No	12,500

¹ Source: Derived from the City of Ontario General Plan (1992), Infrastructure Element, Figure INF-2 and Table INF-1.

² Some arterial streets may be narrower than the right-of-way or curb-to-curb standard indicated above.

³ Median not necessarily raised and/or landscaped.

⁴ Two-way left-turn lane.

2.4 TRAFFIC SIGNAL WARRANT ANALYSIS METHODOLOGY

The term "signal warrants" refers to the list of established criteria used by Caltrans and other public agencies to quantitatively justify or ascertain the potential need for installation of a traffic signal at an otherwise unsignalized intersection. This TIA uses the signal warrant criteria presented in the latest edition of the Federal Highway Administration's (FHWA) *Manual on Uniform Traffic Control Devices (MUTCD)*, as amended by the *MUTCD 2014 California Supplement*, for all study area intersections. (6)

The signal warrant criteria for Existing study area intersections are based upon several factors, including volume of vehicular and pedestrian traffic, frequency of accidents, and location of school areas. Both the FHWA's *MUTCD* and the *MUTCD 2014 California Supplement* indicate that the installation of a traffic signal should be considered if one or more of the signal warrants are met. (6) Specifically, this TIA utilizes the Peak Hour Volume-based Warrant 3 as the appropriate representative traffic signal warrant analysis for existing traffic conditions. Warrant 3 criteria are basically identical for both the FHWA's *MUTCD* and the *MUTCD 2014 California Supplement*. Warrant 3 is appropriate to use for this TIA because it provides specialized warrant criteria for intersections with rural characteristics (e.g. located in communities with populations of less than 10,000 persons or with adjacent major streets operating above 40 miles per hour). For the purposes of this study, the speed limit was the basis for determining whether Urban or Rural warrants were used for a given intersection.

Future unsignalized intersections, that currently do not exist, have been assessed regarding the potential need for new traffic signals based on future average daily traffic (ADT) volumes, using the Caltrans planning level ADT-based signal warrant analysis worksheets. As shown on Table 2-4, traffic signal warrant analyses were performed for the following unsignalized study area intersections during the peak weekday conditions wherein the Project is anticipated to contribute the highest trips:

TABLE 2-4: TRAFFIC SIGNAL WARRANT ANALYSIS LOCATIONS

ID	Intersection Location	Jurisdiction
7	Grove Av. / Merrill Av.	Ontario/Chino
8	Flight Av. / Merrill Av.	Ontario/Chino
9	Hellman Av. / Merrill Av.	Ontario/Chino
10	Hellman Av. / Kimball Av.	Chino/Eastvale
13	Driveway 2 / Merrill Av.	Ontario
19	Archibald Av. / Schaefer Av.	Ontario
24	Archibald Av. / Driveway 4	Ontario

The Existing conditions traffic signal warrant analysis is presented in the subsequent section, Section 3 *Area Conditions* of this report. The traffic signal warrant analyses for future conditions are presented in Section 5 *E+P Traffic Analysis*, Section 6 *Opening Year Cumulative (2019) Traffic Analysis*, and Section 7 *Horizon Year (2040) Traffic Analysis* of this report. It is important to note that a signal warrant defines the minimum condition under which the installation of a traffic signal might be warranted. Meeting this threshold condition does not require that a traffic control signal be installed at a particular location, but rather, that other traffic factors and conditions be evaluated in order to determine whether the signal is truly justified. It should also be noted that signal warrants do not necessarily correlate with LOS. An intersection may satisfy a signal warrant condition and operate at or above acceptable LOS or operate below acceptable LOS and not meet a signal warrant.

2.5 FREEWAY OFF-RAMP QUEUING ANALYSIS

The study area for this TIA includes the freeway-to-arterial interchanges of the SR-71 Freeway at Euclid Avenue (SR-83) off-ramps, SR-60 Freeway at Archibald Avenue off-ramps, I-15 Freeway at Cantu Galleano Ranch Road off-ramps, and I-15 Freeway at Limonite Avenue off-ramps. Consistent with Caltrans requirements, the 95th percentile queuing of vehicles has been assessed at the off-ramps to determine potential queuing impacts at the freeway ramp intersections on Euclid Avenue (SR-83), Archibald Avenue, Cantu Galleano Ranch Road, and Limonite Avenue. Specifically, the queuing analysis is utilized to identify any potential queuing and “spill back” onto the SR-71 Freeway, SR-60 Freeway, and I-15 Freeway mainline from the off-ramps.

The traffic progression analysis tool and HCM intersection analysis program, Synchro, has been used to assess the potential impacts/needs of the intersections with traffic added from the proposed Project. Storage (turn-pocket) length recommendations at the ramps have been based upon the 95th percentile queue resulting from the Synchro progression analysis. There are two footnotes which appear on the Synchro outputs. One footnote indicates if the 95th percentile cycle exceeds capacity. Traffic is simulated for two complete cycles of the 95th percentile traffic in Synchro in order to account for the effects of spillover between cycles. In practice, the 95th percentile queue shown will rarely be exceeded and the queues shown with the footnote are acceptable for the design of storage bays. The other footnote indicates whether or not the volume for the 95th percentile queue is metered by an upstream signal. In many cases, the 95th percentile queue will not be experienced and may potentially be less than the 50th percentile

queue due to upstream metering. If the upstream intersection is at or near capacity, the 50th percentile queue represents the maximum queue experienced.

A vehicle is considered queued whenever it is traveling at less than 10 feet/second. A vehicle will only become queued when it is either at the stop bar or behind another queued vehicle. Although only the 95th percentile queue has been reported in the tables, the 50th percentile queue can be found in the appendix alongside the 95th percentile queue for each ramp location. The 50th percentile maximum queue is the maximum back of queue on a typical cycle during the peak hour, while the 95th percentile queue is the maximum back of queue with 95th percentile traffic volumes during the peak hour. In other words, if traffic were observed for 100 cycles, the 95th percentile queue would be the queue experienced with the 95th busiest cycle (or 5% of the time). The queue length reported is for the lane with the highest queue in the lane group. The 50th percentile or average queue represents the typical queue length for peak hour traffic conditions, while the 95th percentile queue is derived from the average queue plus 1.65 standard deviations. The 95th percentile queue is not necessarily ever observed, it is simply based on statistical calculations.

2.6 FREEWAY MAINLINE SEGMENT ANALYSIS METHODOLOGY

Consistent with recent Caltrans guidance and because impacts to freeway segments dissipate with distance from the point of SHS entry, quantitative study of freeway segments beyond those immediately adjacent to the point of entry is not required. As such, the traffic study has evaluated the freeway segments along the SR-71 Freeway, SR-60 Freeway, and I-15 Freeway where the Project is anticipated to contribute 25 or more one-way peak hour trips. Because impacts to freeway segments dissipate with distance from the point of SHS entry, quantitative evaluation of freeway segments with less than 25 peak hour trips is not necessary.

The freeway system in the study area has been broken into segments defined by the freeway-to-arterial interchange locations. The freeway segments have been evaluated in this TIA based upon peak hour directional volumes. The freeway segment analysis is based on the methodology described in the HCM and performed using HCS2010 software. The performance measure preferred by Caltrans to calculate LOS is density. Density is expressed in terms of passenger cars per mile per lane. Table 2-5 illustrates the freeway segment LOS descriptions for each density range utilized for this analysis. The number of lanes for existing baseline conditions has been obtained from field observations conducted by Urban Crossroads in April and December of 2016. These existing freeway geometrics have been utilized for Existing, E+P, Opening Year Cumulative (2019) Without and With Project, and Horizon Year (2040) Without and With Project conditions.

The SR-71 Freeway, SR-60 Freeway, and I-15 Freeway mainline volume data were obtained from the Caltrans Performance Measurement System (PeMS) website for the segments of the SR-71 Freeway north of Euclid Avenue (SR-83), SR-60 Freeway west of Archibald Avenue, I-15 Freeway north of Cantu Galleano Ranch Road, and I-15 Freeway north of Limonite Avenue. The data was obtained from May 2016. In an effort to conduct a conservative analysis, the maximum value observed within the three-day period was utilized for the weekday morning (AM) and weekday evening (PM) peak hours. In addition, truck traffic, represented as a percentage of total traffic, has been utilized for the purposes of this analysis in an effort to not overstate traffic volumes and

peak hour deficiencies. As such, actual vehicles (as opposed to passenger-car-equivalent volumes) have been utilized for the purposes of the basic freeway segment analysis. (7)

TABLE 2-5: DESCRIPTION OF FREEWAY MAINLINE LOS

Level of Service	Description	Density Range (pc/mi/ln) ¹
A	Free-flow operations in which vehicles are relatively unimpeded in their ability to maneuver within the traffic stream. Effects of incidents are easily absorbed.	0.0 – 11.0
B	Relative free-flow operations in which vehicle maneuvers within the traffic stream are slightly restricted. Effects of minor incidents are easily absorbed.	11.1 – 18.0
C	Travel is still at relative free-flow speeds, but freedom to maneuver within the traffic stream is noticeably restricted. Minor incidents may be absorbed, but local deterioration in service will be substantial. Queues begin to form behind significant blockages.	18.1 – 26.0
D	Speeds begin to decline slightly and flows and densities begin to increase more quickly. Freedom to maneuver is noticeably limited. Minor incidents can be expected to create queuing as the traffic stream has little space to absorb disruptions.	26.1 – 35.0
E	Operation at capacity. Vehicles are closely spaced with little room to maneuver. Any disruption in the traffic stream can establish a disruption wave that propagates throughout the upstream traffic flow. Any incident can be expected to produce a serious disruption in traffic flow and extensive queuing.	35.1 – 45.0
F	Breakdown in vehicle flow.	>45.0

¹ pc/mi/ln = passenger cars per mile per lane. Source: HCM 2010

2.7 FREEWAY MERGE/DIVERGE RAMP JUNCTION ANALYSIS

The freeway system in the study area has been broken into segments defined by freeway-to-arterial interchange locations resulting in two existing on and off ramp locations. Although the HCM indicates the influence area for a merge/diverge junction is 1,500 feet, the analysis presented in this traffic study has been performed at all ramp locations with respect to the nearest on or off ramp at each interchange in an effort to be consistent with Caltrans guidance/comments on other projects Urban Crossroads has worked on in the region.

The merge/diverge analysis is based on the HCM Ramps and Ramp Junctions analysis method and performed using HCS2010 software. The measure of effectiveness (reported in passenger car/mile/lane) are calculated based on the existing number of travel lanes, number of lanes at the on and off ramps both at the analysis junction and at upstream and downstream locations (if applicable) and acceleration/deceleration lengths at each merge/diverge point. Table 2-6 presents the merge/diverge area level of service descriptions for each density range utilized for this analysis.

TABLE 2-6: DESCRIPTION OF FREEWAY MERGE AND DIVERGE LOS

Level of Service	Density Range (pc/mi/ln) ¹
A	≤10.0
B	10.0 – 20.0
C	20.0 – 28.0
D	28.0 – 35.0
E	>35.0
F	Demand Exceeds Capacity

¹ pc/mi/ln = passenger cars per mile per lane. Source: HCM 2010

Similar to the basic freeway segment analysis, the SR-71, SR-60, and I-15 Freeway mainline volume data were obtained from the Caltrans PeMS website for the segments of the SR-71 Freeway north of Euclid Avenue (SR-83), SR-60 Freeway west of Archibald Avenue, I-15 Freeway north of Cantu Galleano Ranch Road, and I-15 Freeway north of Limonite Avenue. The ramp data (per the count data presented in Appendix 3.1, and if applicable, were increased to reflect 2017 conditions) were then utilized to flow conserve the mainline volumes to determine the remaining SR-71, SR-60, and I-15 Freeway mainline segment volumes. Flow conservation checks ensure that traffic flows from east to west and north to south (and vice versa) of the interchange area with no unexplained loss of vehicles. The data was obtained from May 2016. In an effort to conduct a conservative analysis, the maximum value observed within the three-day period was utilized for the weekday morning (AM) and weekday evening (PM) peak hours. In addition, truck traffic, represented as a percentage of total traffic, has been utilized for the purposes of this analysis in an effort to not overstate traffic volumes and peak hour deficiencies. (7) As such, actual vehicles (as opposed to passenger-car-equivalent volumes) have been utilized for the purposes of the freeway ramp junction (merge/diverge) analysis.

2.8 MINIMUM ACCEPTABLE LEVELS OF SERVICE (LOS) AND INTERSECTION DEFICIENCY CRITERIA

Minimum Acceptable Levels of Service (LOS) and associated definitions of intersection deficiencies has been obtained from each of the applicable surrounding jurisdictions.

2.8.1 CITY OF ONTARIO

According to the City of Ontario’s General Plan, LOS E is the minimum acceptable condition that should be maintained during the peak commute hours, where feasible. Therefore, any intersection operating at LOS F is considered deficient. LOS will also be reported by movement for the City’s review. A higher LOS standard of LOS D has been applied to the Project driveways. LOS D has been utilized as the minimum LOS for all roadway segments.

2.8.2 CITY OF CHINO HILLS

The City of Chino Hills utilizes a minimum acceptable LOS of LOS D, where feasible.

2.8.3 CITY OF CHINO

The City of Chino utilizes a minimum acceptable LOS of LOS D, where feasible.

2.8.4 CITY OF EASTVALE

The City of Eastvale General Plan Policy C-10 sets a standard of LOS C with LOS D as acceptable in commercial and employment areas and at intersections of any combination of major highways, urban arterials, secondary highways, or freeway ramps. Based on this criterion, where feasible, LOS D is the minimum acceptable LOS at each of the study intersections within the City of Eastvale.

2.8.5 CITY OF JURUPA VALLEY

The City of Jurupa Valley utilizes a minimum acceptable LOS of LOS D, where feasible.

2.8.6 CMP

The CMP definition of deficiency is based on maintaining a level of service standard of LOS E or better, where feasible, except where an existing LOS F condition is identified in the CMP document. However, in an effort to overstate as opposed to understate potential impacts, LOS D has been utilized for the CMP intersections for the purposes of this analysis.

2.8.7 CALTRANS

Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D on SHS facilities, however, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. If an existing State highway facility is operating at less than this target LOS, the existing LOS should be maintained. In general, the region-wide goal for an acceptable LOS on all freeways, roadway segments, and intersections is LOS D. In excess of the City of Ontario LOS threshold of LOS E and consistent with the City of Chino stated LOS threshold of LOS D, LOS D will be used as the target LOS for freeway ramps, freeway segments, and freeway merge/diverge ramp junctions.

2.9 THRESHOLDS OF SIGNIFICANCE

This section outlines the methodology used in this analysis related to identifying circulation system deficiencies.

2.9.1 INTERSECTIONS

To determine whether the addition of project traffic (as defined through the comparison of Existing traffic conditions to E+P traffic conditions) at a study intersection would result in a direct project-specific traffic impact, the following will be utilized:

- When the pre-Project condition is at or better than LOS D (or LOS E for CMP intersections and intersections located in the City of Ontario) (i.e., acceptable LOS), and project-generated traffic, as measured by 50 or more peak hour trips, causes deterioration below LOS D/LOS E (i.e., unacceptable LOS), a deficiency is deemed to occur.

However, when the pre-Project condition is already below LOS D/LOS E (i.e., unacceptable LOS), the Project will be responsible for mitigating its impact to a level of service equal to or better than it was without the Project for intersections that receive 50 or more peak hour project-

related trips. This is a standard protocol in many urban jurisdictions because to require a Project to mitigate to LOS D/LOS E or better would in effect force the Project to mitigate beyond its Project impacts, which is prohibited under California law. Thus, for intersections currently operating at unacceptable LOS during either the AM and/or PM peak hour under Existing traffic conditions, improvements have been identified to mitigate the impacts of the Project to an intersection LOS that is equal to or better than pre-Project conditions.

For the study area intersections that lie within the City of Eastvale, project-related significant impacts will be identified by comparing the “Without Project” condition to the “With Project” condition based on the following criteria:

- If the LOS deteriorates from acceptable LOS (LOS D or better) to unacceptable LOS (LOS E or F); or
- If the intersection is already operating at an unacceptable LOS (LOS E or F) in “Without Project” conditions and the addition of Project traffic increases the delay by more than 5.0 seconds.

Cumulative traffic impacts are created as a result of a combination of the proposed Project together with other future developments contributing to the overall traffic impacts requiring additional improvements to maintain acceptable level of service operations with or without the Project. A Project’s contribution to a significant cumulative impact can be reduced to less than significant if the Project is required to implement or fund its fair share of improvements designed to alleviate its cumulatively considerable contribution to the impact. Cumulatively considerable is defined as the addition of 50 or more peak hour trips.

In the event that an intersection is operating at or is forecast to operate at a deficient LOS, the CMP guidelines have defined a series of steps to be completed to determine the Project’s contribution to the deficiency of intersections, which has been applied to both CMP and non-CMP study area intersections. The steps are as follows:

- Determine the mitigation measures necessary to achieve an acceptable service level,
- Calculate the Project’s share in the future traffic volume projections for the peak hours,
- Estimate the cost to implement recommended mitigation measures, and
- Calculate the Project’s fair-share contribution to mitigate the Project’s traffic impacts

2.9.2 ROADWAY SEGMENTS

To determine whether the addition of project traffic on study area roadway segments would result in a significant traffic impact, the following will be utilized:

- When the pre-Project condition is at or better than LOS D (or LOS E for CMP roadways located in the City of Ontario) (i.e., acceptable LOS), and project-generated traffic, as measured by 50 or more peak hour trips, causes deterioration below LOS D/LOS E (i.e., unacceptable LOS), a deficiency is deemed to occur.

However, when the pre-Project condition is already below LOS D/LOS E (i.e., unacceptable LOS), the Project will be responsible for mitigating its impact to a level of service equal to or better than it was without the Project for roadway segments that receive 50 or more peak hour project-related trips. This is a standard protocol in many urban jurisdictions because to require a Project

to mitigate to LOS D/LOS E or better would in effect force the Project to mitigate beyond its Project impacts, which is prohibited under California law.

Cumulative traffic impacts are created as a result of a combination of the proposed Project together with other future developments contributing to the overall traffic impacts requiring additional improvements to maintain acceptable level of service operations with or without the Project. A Project’s contribution to a significant cumulative impact can be reduced to less than significant if the Project is required to implement or fund its fair share of improvements designed to alleviate its cumulatively considerable contribution to the impact. Cumulatively considerable impacts are defined as the addition of 50 or more peak hour trips.

2.9.3 CALTRANS FACILITIES

To determine whether the addition of project traffic to the SHS freeway segments would result in a deficiency, the following will be utilized:

- The traffic study finds that the LOS of a segment will degrade from D or better to E or F.
- The traffic study finds that the project will exacerbate an already deficient condition by contributing 25 or more one-way peak hour trips. A segment that is operating at or near capacity is deemed to be deficient.

2.10 PROJECT FAIR SHARE CALCULATION METHODOLOGY

In cases where this TIA identifies that the Project would contribute additional traffic volumes to cumulative traffic deficiencies, Project fair share costs of improvements necessary to address deficiencies have been identified. The Project’s fair share cost of improvements is determined based on the following equation, which is the ratio of Project traffic to new traffic, and new traffic is total future (Horizon Year) traffic less existing baseline traffic:

$$\text{Project Fair Share \%} = \text{Project Traffic} / (\text{2040 With Project Total Traffic} - \text{Existing Traffic})$$

The Project fair share contribution calculations are presented in Section 1.5 *Local and Regional Funding Mechanisms* of this TIA. The cost of implementing the improvements shown on Table 1-4 have been estimated based on the preliminary construction cost estimates found in Appendix G of the San Bernardino County CMP in conjunction with a total cost escalation factor of 1.484 to more closely approximate current (2017) costs. These cost estimates have been utilized in conjunction with the Project fair share percentages to determine the Project’s fair share cost of the recommended cumulative improvements (see Table 1-5). These estimates are a rough order of magnitude only as they are intended only for discussion purposes and do not imply any legal responsibility or formula for contributions or mitigation.

3 AREA CONDITIONS

This section provides a summary of the existing circulation network, the City of Ontario General Plan Circulation Network, and a review of existing peak hour intersection operations, freeway mainline operations, and traffic signal warrant analyses.

3.1 EXISTING CIRCULATION NETWORK

Pursuant to the agreement with City of Ontario staff (Appendix 1.1), the study area includes a total of 37 existing and future intersections as shown previously on Exhibit 1-2. Exhibit 3-1 illustrates the study area intersections located near the proposed Project and identifies the number of through traffic lanes for existing roadways and intersection traffic controls.

3.2 CITY OF ONTARIO GENERAL PLAN CIRCULATION ELEMENT

As noted previously, the Project site is located within the City of Ontario. The roadway classifications and planned (ultimate) roadway cross-sections of the major roadways within the study area, as identified on the City of Ontario General Plan Circulation Element, are described subsequently. Exhibit 3-2 shows the City of Ontario General Plan Circulation Element, and Exhibit 3-3 illustrates the City of Ontario General Plan roadway cross-sections.

The study area roadways that are classified as 8-lane Principal Arterials are identified as having four lanes of travel in each direction. The following study area roadways within the City of Ontario are classified as 8-lane Principal Arterials:

- Euclid Avenue (SR-83) north of Merrill Avenue
- Edison Avenue/Ontario Ranch Road from Euclid Avenue (SR-83) to Hamner Avenue
- Hamner Avenue between the SR-60 Freeway and Bellegrave Avenue

The study area roadway that is classified as a 6-lane Principal Arterial is identified as having three lanes of travel in each direction and a 14-foot curbed or painted median. The following study area roadways within the City of Ontario are classified as a 6-lane Principal Arterial:

- Hellman Avenue (Vineyard Avenue) north of Merrill Avenue
- Archibald Avenue north of Bellegrave Avenue

The study area roadway that is classified as a 4-lane Principal Arterial is identified as having two lanes of travel in each direction. The following study area roadway within the City of Ontario is classified as a 4-lane Principal Arterial:

- Grove Avenue north of Merrill Avenue

EXHIBIT 3-3: CITY OF ONTARIO GENERAL PLAN ROADWAY CROSS-SECTIONS

SOURCE: CITY OF ONTARIO

The study area roadway that is classified as a 6-lane Minor Arterial is identified as having three lanes of travel in each direction. The following study area roadway within the City of Ontario is classified as a 6-lane Minor Arterial:

- Riverside Drive

The study area roadway that is classified as a 4-lane Minor Arterial is identified as having two lanes of travel in each direction and a 14-foot median. The following study area roadway within the City of Ontario is classified as a 4-lane Minor Arterial:

- Bellegrave Avenue from Haven Avenue to Hamner Avenue

The study area roadways that are classified as Collector Streets are identified as having two to four lanes of travel in each direction. The following study area roadways within the City of Ontario are classified as Collector Streets:

- Chino Avenue
- Schaefer Avenue from Euclid Avenue (SR-83) to Haven Avenue
- Eucalyptus Avenue
- Merrill Avenue
- Bon View Avenue
- Flight Avenue (Walker Avenue)

3.3 CITY OF CHINO, CITY OF CHINO HILLS, AND CITY OF EASTVALE GENERAL PLAN CIRCULATION ELEMENT

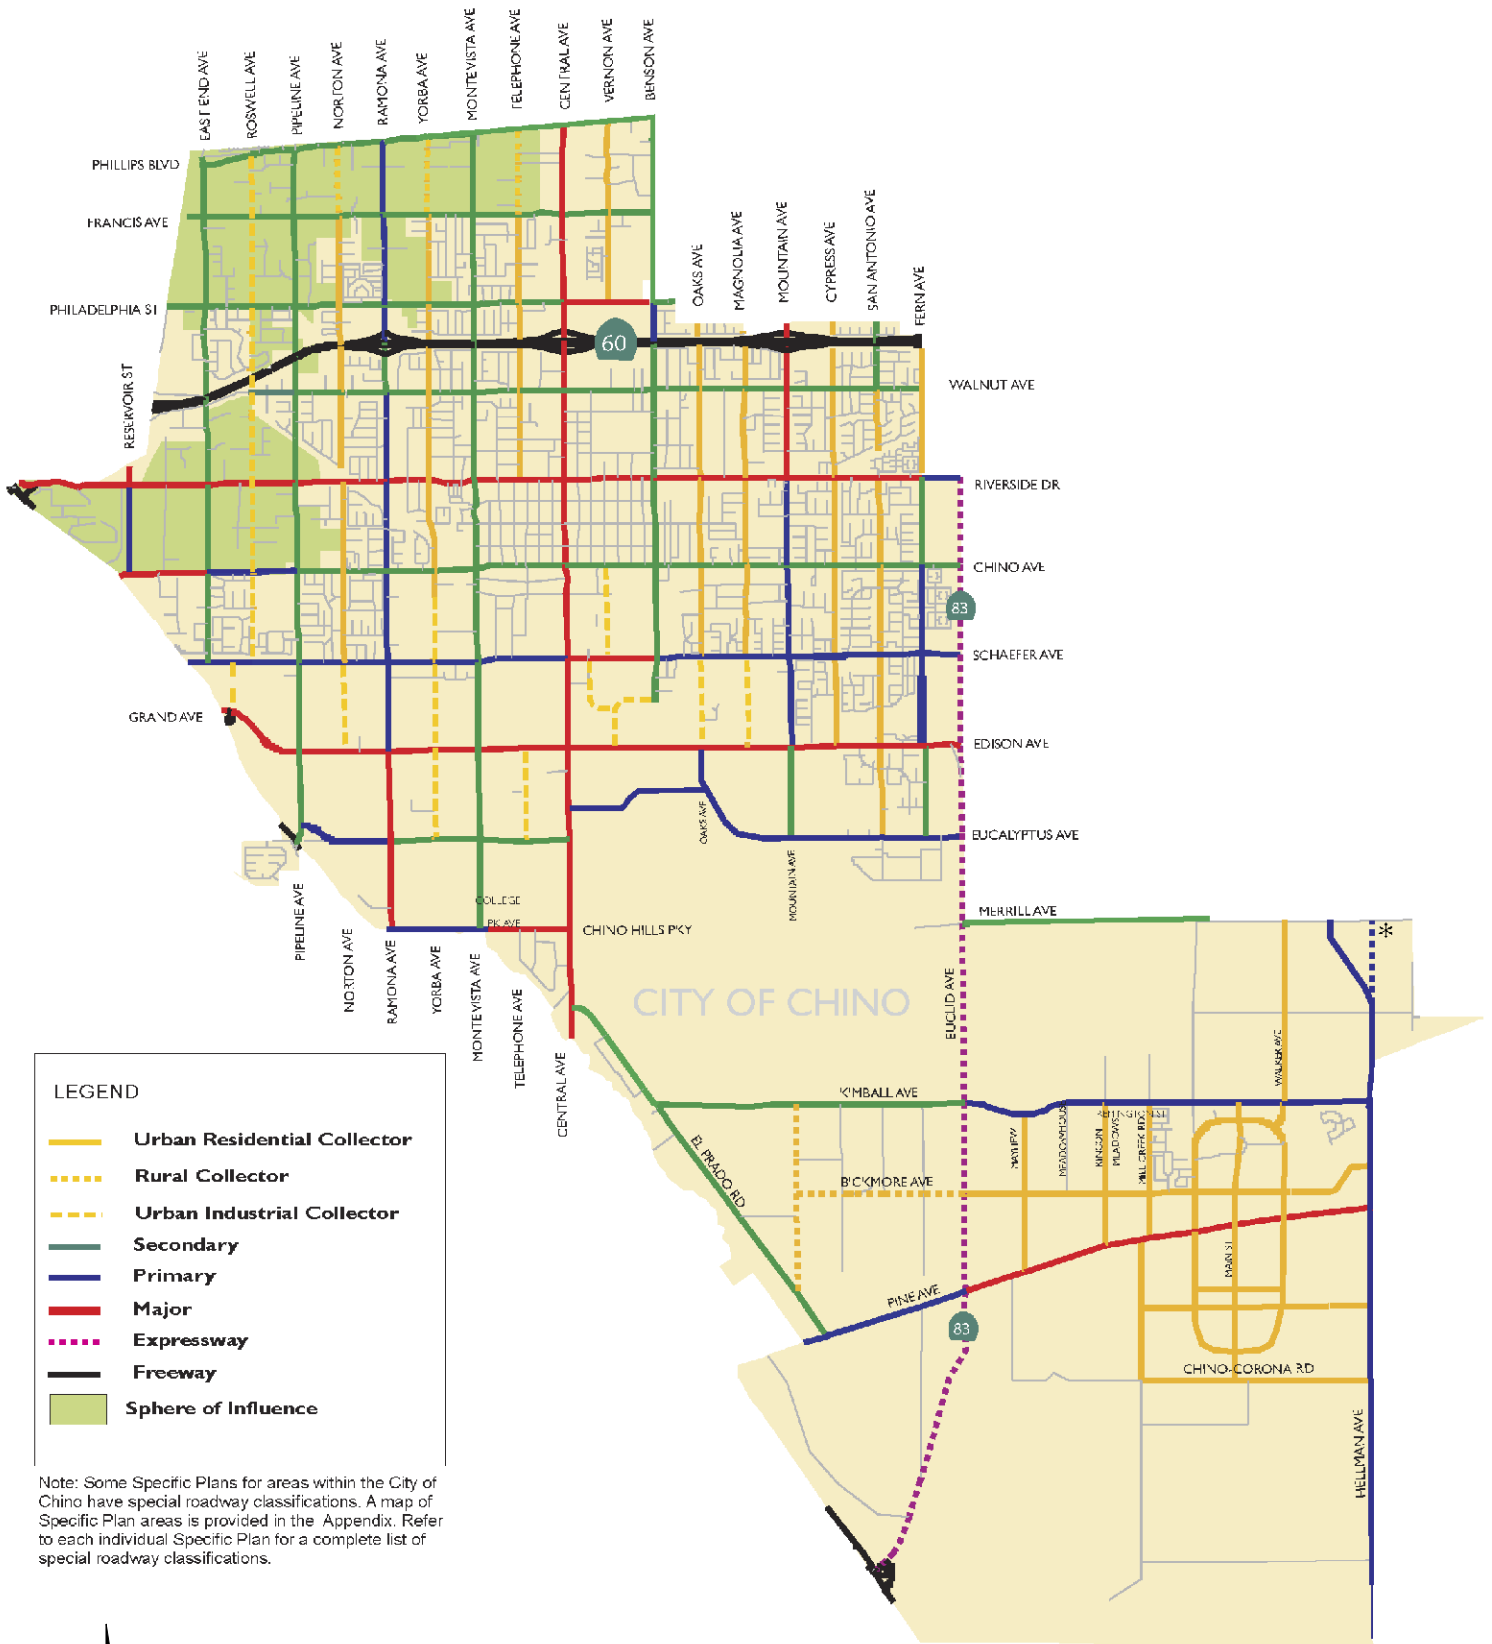

Exhibits 3-4 and 3-5 show the City of Chino General Plan Circulation Element and roadway cross-sections, respectively. Exhibits 3-6 and 3-7 show the City of Chino Hills General Plan Circulation Element and roadway cross-sections, respectively. Exhibits 3-8 and 3-9 show the City of Eastvale General Plan Circulation Element and roadway cross-sections, respectively.

3.4 TRUCK ROUTES

The City of Ontario designated truck route map is shown on Exhibit 3-10. Euclid Avenue (SR-83), Edison Avenue/Ontario Ranch Road, Merrill Avenue, Archibald Avenue, and Hamner Avenue/Milliken Avenue are designated as a Truck Route in the City of Ontario. The designated truck route map has been utilized to route truck traffic from both the proposed Project and future cumulative development projects throughout the study area.

The City of Chino designated truck route map is shown on Exhibit 3-11. Merrill Avenue, Kimball Avenue, Pine Avenue, Flight Avenue, and Hellman Avenue are some of the designated City of Chino truck routes near the Project while Euclid Avenue (SR-83) is designated as a State Truck Route. Other truck routes in the study area include, Riverside Drive and Edison Drive. The designated truck route map has been utilized to route truck traffic from both the proposed Project and future cumulative development projects throughout the study area.

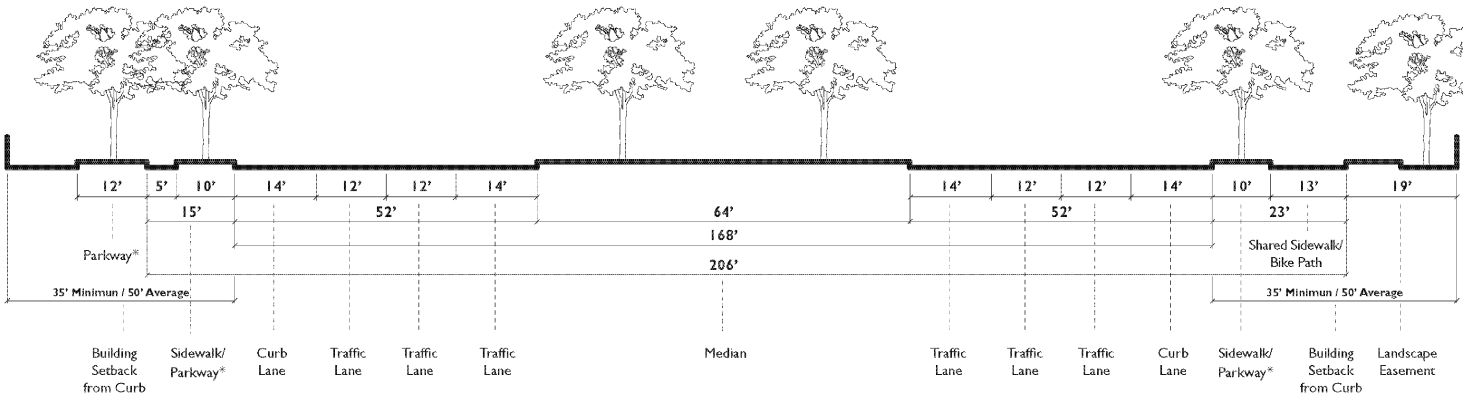

EXHIBIT 3-4: CITY OF CHINO GENERAL PLAN CIRCULATION ELEMENT

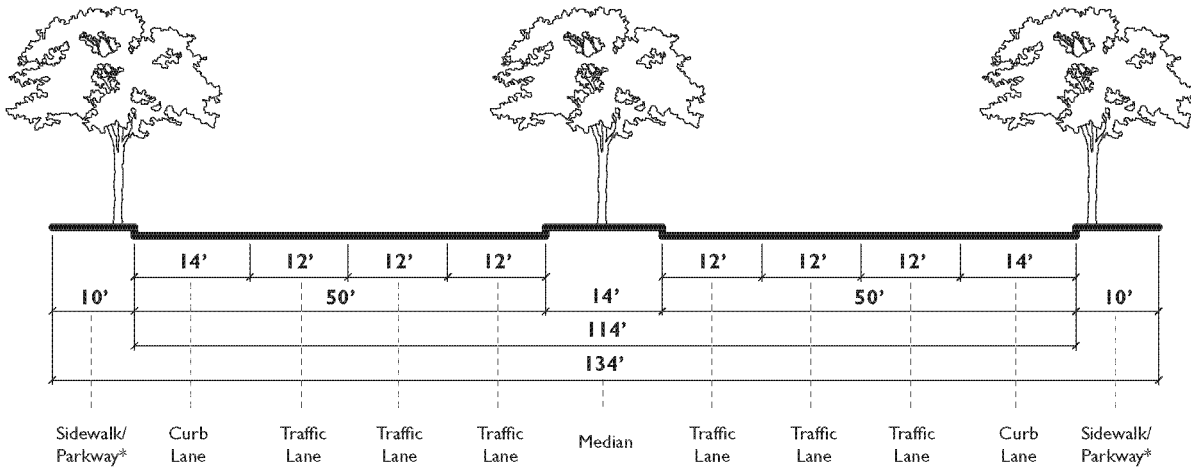

* Potential Alternative Hellman Avenue Alignment

EXHIBIT 3-5 (1 of 2): CITY OF CHINO GENERAL PLAN ROADWAY CROSS-SECTIONS

Major Arterial (Expressway): Typical 8 Lane
 Provides 8 traffic lanes and a wide median without parking

Major Arterial: Minimum 8 Lane
 Provides 8 traffic lanes and 2 bicycle lanes separated by a median without parking

Major Arterial: Minimum 6 Lane
 Provides 6 traffic lanes and 2 bicycle lanes separated by a median without parking

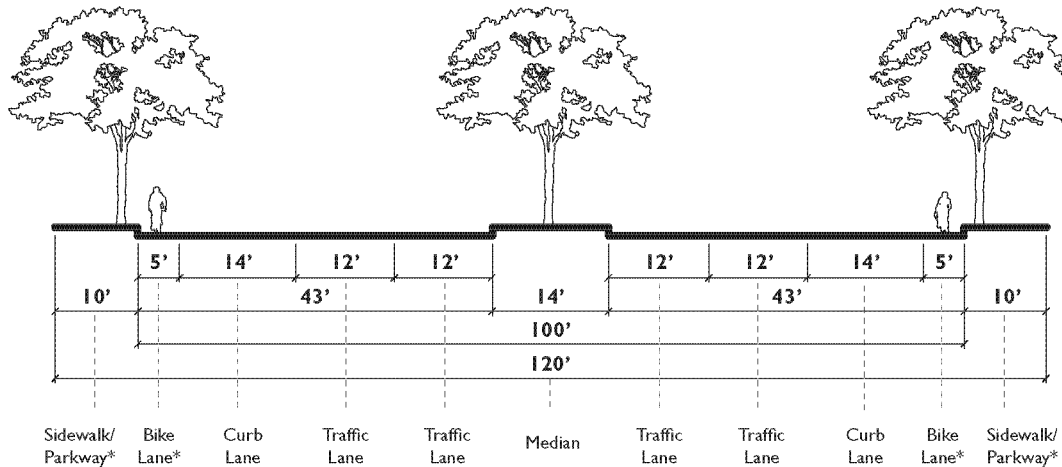

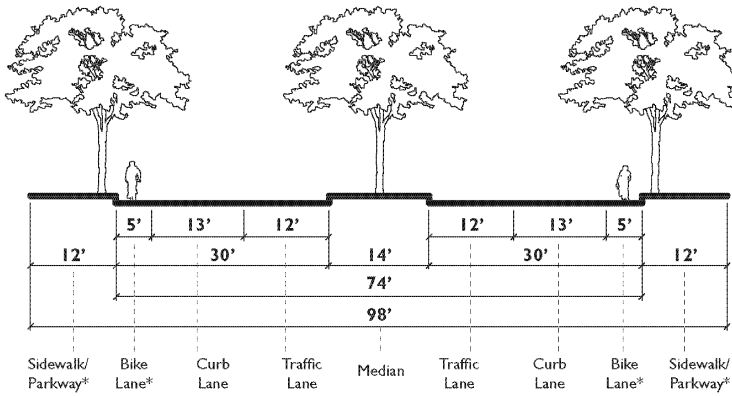

EXHIBIT 3-5 (2 of 2): CITY OF CHINO GENERAL PLAN ROADWAY CROSS-SECTIONS

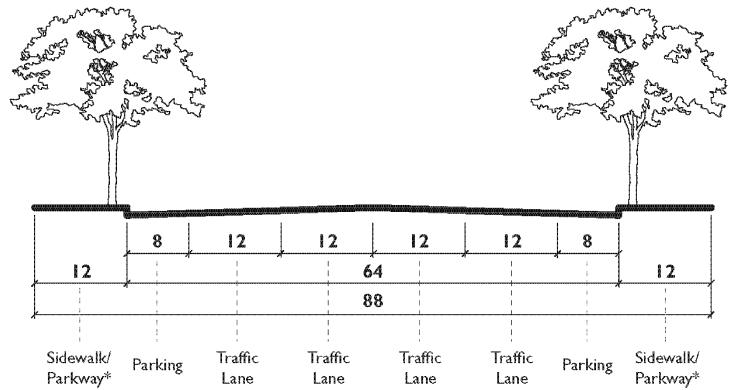

Primary Arterial: Typical 4 Lane

Provides 4 traffic lanes and 2 bicycle lanes separated by a median without parking

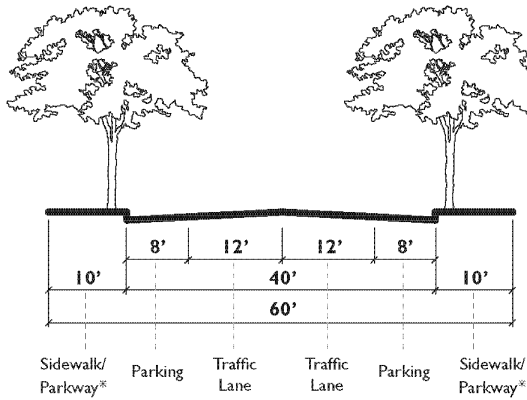

Secondary Arterial

Provides 4 traffic lanes with parking

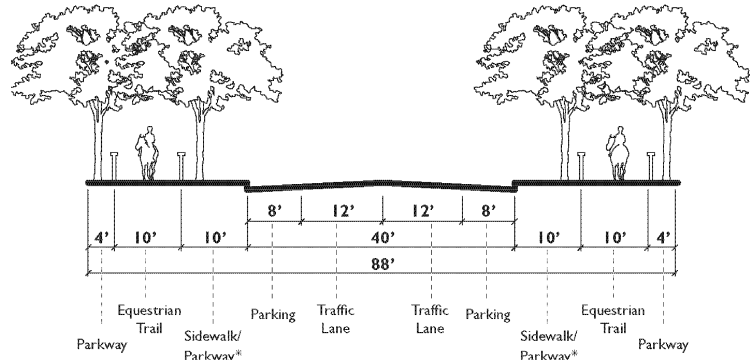

Urban Residential/Rural Collector

Provides 2 traffic lanes with parking and shared bicycle access

Urban Residential/Rural Collector with Equestrian Trails

Provides 2 traffic lanes and 2 equestrian trails with parking and shared bicycle access

Urban Industrial Collector

Provides 2 traffic lanes

Local Street

Provides 2 traffic lanes

3.5 BICYCLE, EQUESTRIAN, & PEDESTRIAN FACILITIES

Field observations conducted in April and December of 2016 indicate nominal pedestrian and bicycle activity within the study area. Exhibit 3-12 illustrates the City of Ontario future planned bicycle facilities, which proposes Class II and Multipurpose Trails along Merrill Avenue adjacent to the Project and the Cucamonga Creek Multipurpose Trail located immediately to the west of the Project. Exhibit 3-13 illustrates City of Chino future bicycle facilities, which proposes Class I bicycle facilities along Pine Avenue, Hellman Avenue, and Kimball Avenue near the vicinity of the site. Exhibit 3-14 illustrates the City of Eastvale trails and bikeway systems. Existing pedestrian facilities within the study area are shown on Exhibit 3-15.

3.6 TRANSIT SERVICE

The study area within the City of Chino is currently served by Omnitrans, a public transit agency serving various jurisdictions within San Bernardino County. Based on a review of the existing transit routes within the vicinity of the proposed Project, Omnitrans Route 81 operates on Riverside Drive north of the site. However, there are no existing bus routes near the vicinity of the Project. The Riverside Transit Authority (RTA) serves the City of Eastvale. Transit service is reviewed and updated by Omnitrans periodically to address ridership, budget and community demand needs. Changes in land use can affect these periodic adjustments which may lead to either enhanced or reduced service where appropriate. As such, it is recommended that the applicant work in conjunction with Omnitrans and RTA to potentially provide additional bus service to the site. Existing transit routes in the vicinity of the study area are illustrated on Exhibit 3-16.

3.7 EXISTING (2017) TRAFFIC COUNTS

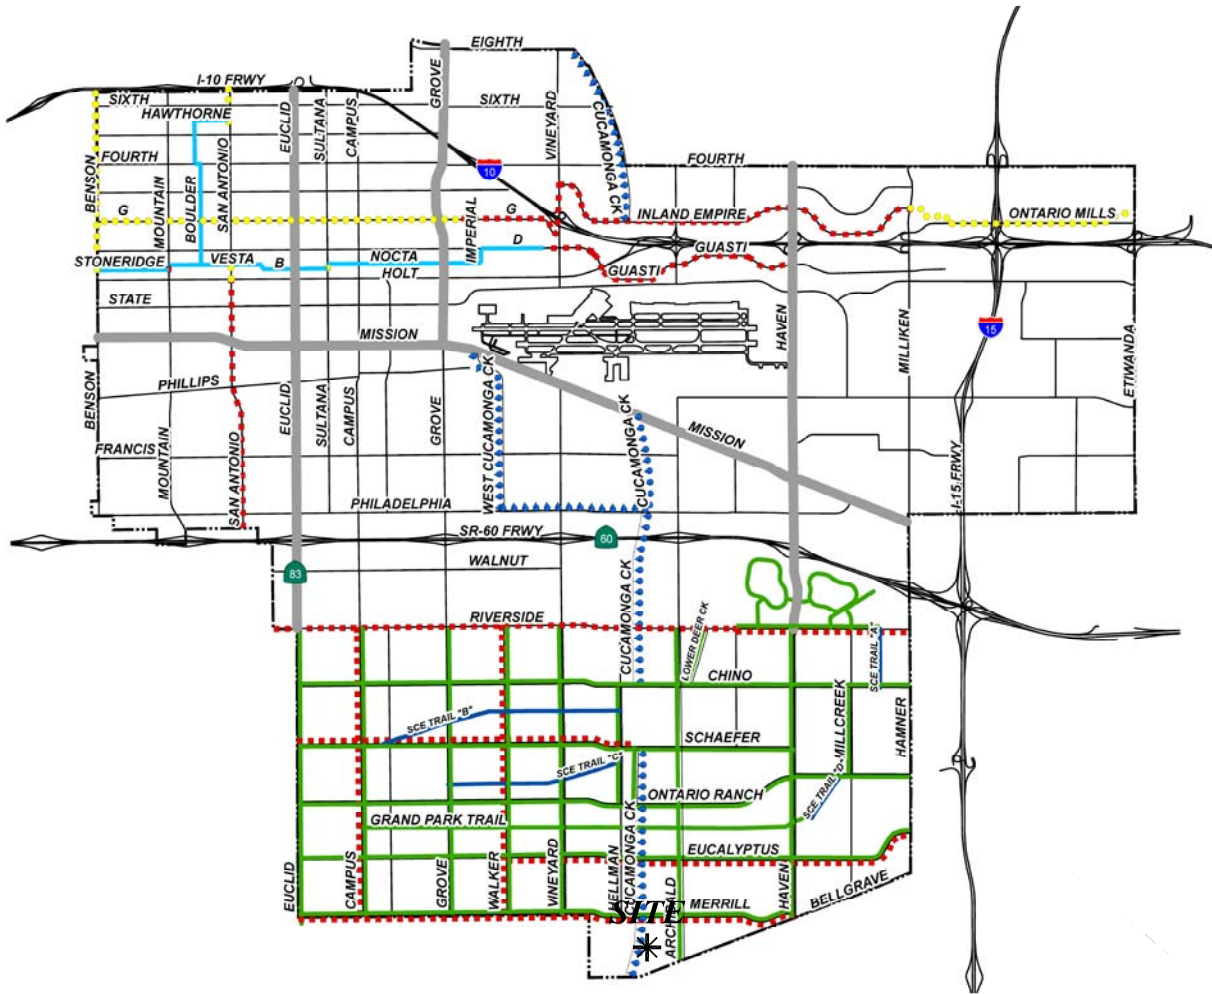

The intersection LOS analysis is based on the traffic volumes observed during the peak hour conditions using traffic count data collected in April and December of 2016. The following peak hours were selected for analysis:

- Weekday AM Peak Hour (peak hour between 7:00 AM and 9:00 AM)
- Weekday PM Peak Hour (peak hour between 4:00 PM and 6:00 PM)

The weekday AM and weekday PM peak hour count data is representative of typical weekday peak hour traffic conditions in the study area. There were no observations made in the field that would indicate atypical traffic conditions on the count dates, such as construction activity or detour routes and near-by schools were in session and operating on normal schedules. The raw manual peak hour turning movement traffic count data sheets are included in Appendix 3.1.

The traffic counts collected in April and December of 2016 include the following vehicle classifications: Passenger Cars, 2-Axle Trucks, 2-Axle Trucks, and 4 or More Axle Trucks.

Exhibit 2.8-2 Planned Trails

EXHIBIT 3-15: EXISTING PEDESTRIAN FACILITIES

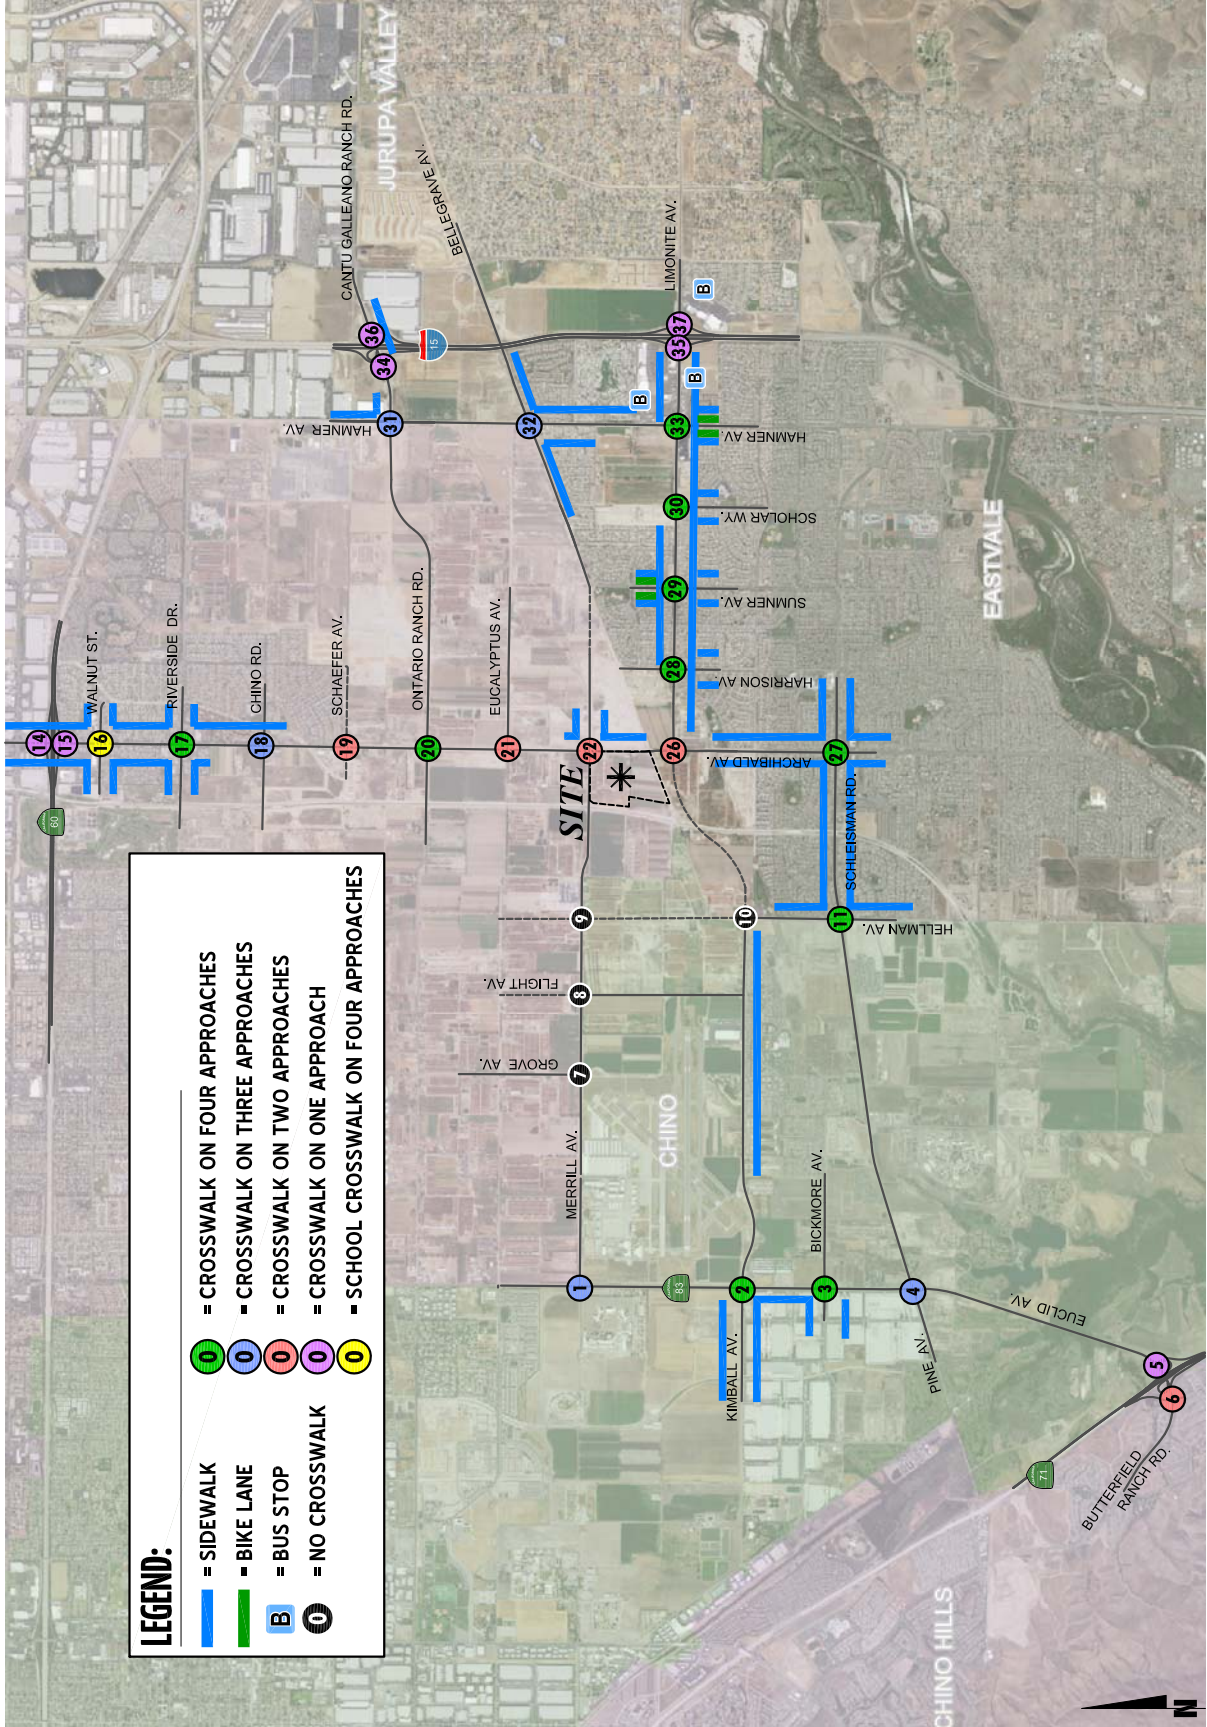

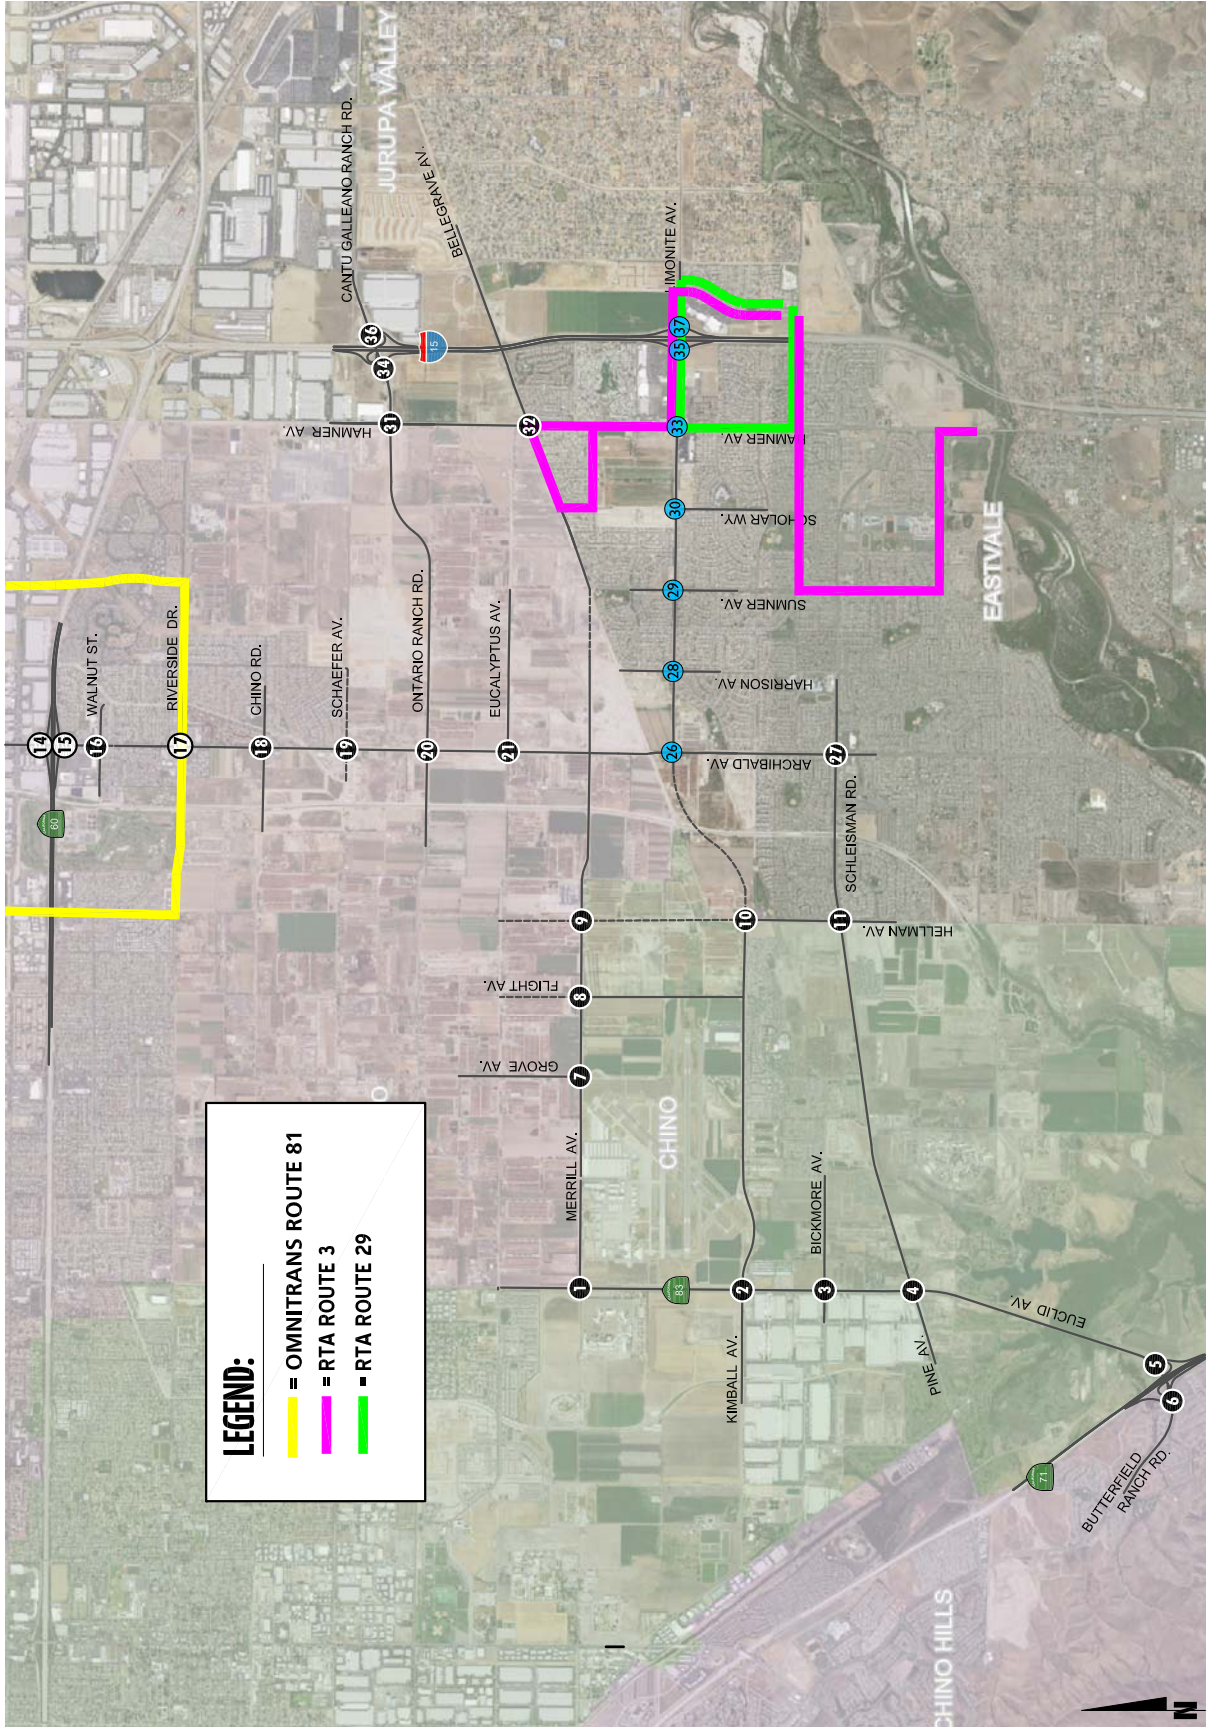

EXHIBIT 3-16: EXISTING TRANSIT ROUTES

To represent the impact large trucks, buses and recreational vehicles have on traffic flow; all trucks were converted into PCE. By their size alone, these vehicles occupy the same space as two or more passenger cars. In addition, the time it takes for them to accelerate and slow-down is much longer than for passenger cars, and varies depending on the type of vehicle and number of axles. For the purpose of this analysis, a PCE factor of 1.5 has been applied to 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4+-axle trucks to estimate each turning movement. These factors are consistent with the values recommended for use in the CMP.

Existing weekday ADT volumes are shown on Exhibit 3-17. Where actual 24-hour tube count data was not available, Existing ADT volumes were based upon factored intersection peak hour counts collected by Urban Crossroads, Inc. using the following formula for each intersection leg:

$$\text{Weekday PM Peak Hour (Approach Volume + Exit Volume)} \times 12.7572 = \text{Leg Volume}$$

A comparison of the PM peak hour and daily traffic volumes of various roadway segments within the study area indicated that the peak-to-daily relationship is approximately 7.84 percent. As such, the above equation utilizing a factor of 12.7572 estimates the ADT volumes on the study area roadway segments assuming a peak-to-daily relationship of approximately 7.84 percent (i.e., $1/0.0784 = 12.7572$) and was assumed to sufficiently estimate average daily traffic (ADT) volumes for planning-level analyses. Existing weekday AM and weekday PM peak hour intersection volumes (in PCE) are shown on Exhibit 3-18.

3.8 INTERSECTION OPERATIONS ANALYSIS

Existing peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2.2 *Intersection Capacity Analysis* of this report. The intersection operations analysis results are summarized in Table 3-1, which indicates that all existing study area intersections are currently operating at acceptable LOS during the peak hours with exception to the following:

- Hellman Av. / Kimball Av. (#10) – LOS F AM and PM peak hours
- Archibald Av. / Limonite Av. (#26) – LOS E PM peak hour only
- Hamner Av. / Ontario Ranch Rd. (#31) – LOS E AM and PM peak hours

Consistent with Table 3-1, a summary of the peak hour intersection LOS for Existing conditions are shown on Exhibit 3-19. The intersection operations analysis worksheets are included in Appendix 3.2 of this TIA.

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

¹ When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; >> = Free-Right Turn Lane; d= Defacto Right Turn Lane

² Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

³ CSS = Cross-street Stop; AWS = All-Way Stop; TS = Traffic Signal

3.9 EXISTING CONDITIONS ROADWAY SEGMENT CAPACITY ANALYSIS

The City of Ontario General Plan provides roadway volume capacity values presented previously on Table 2-3. The roadway segment capacities are approximate figures only, and are used at the General Plan level to assist in determining the roadway functional classification (number of through lanes) needed to meet traffic demand. Table 3-2 provides a summary of the Existing (2017) conditions roadway segment capacity analysis based on the City of Ontario General Plan Roadway Segment Capacity Thresholds identified previously on Table 2-3. As shown on Table 3-2, all but 1 of the study area roadway segments currently operate at an acceptable LOS based on the City's planning level daily roadway capacity thresholds (Archibald Avenue north of the County Line is the only deficient roadway segment).

3.10 TRAFFIC SIGNAL WARRANTS ANALYSIS

Traffic signal warrants for Existing traffic conditions are based on existing peak hour intersection turning volumes. The following study area intersections currently warrant a traffic signal for Existing traffic conditions: Grove Avenue / Merrill Avenue, Flight Avenue / Merrill Avenue, and Hellman Avenue / Kimball Avenue. Existing conditions traffic signal warrant analysis worksheets are provided in Appendix 3.3.

3.11 OFF-RAMP QUEUING ANALYSIS

A queuing analysis was performed for the off-ramps at the SR-71 Freeway and Euclid Avenue (SR-83), SR-60 Freeway and Archibald Avenue, I-15 Freeway and Cantu Galleano Ranch Road, and I-15 Freeway and Limonite Avenue interchanges to assess vehicle queues for the off ramps that may potentially result in deficient peak hour operations at the ramp-to-arterial intersections and may potentially "spill back" onto the SR-71, SR-60, and I-15 Freeway mainlines. Queuing analysis findings are presented in Table 3-3. It is important to note that off-ramp lengths are consistent with the measured distance between the intersection and the freeway mainline. As shown on Table 3-3, there are no movements that are currently experiencing queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows. Worksheets for Existing traffic conditions off-ramp queuing analysis are provided in Appendix 3.4.

3.12 BASIC FREEWAY SEGMENT ANALYSIS

Existing (2017) mainline directional volumes for the AM and PM peak hours are provided on Exhibit 3-20. As shown on Table 3-4, the SR-71, SR-60, and I-15 Freeway segments analyzed for this study were found to operate at an acceptable LOS (i.e., LOS D or better) during the peak hours for Existing (2017) traffic conditions, with exception of the following:

- SR-71 Freeway Southbound, South of Euclid Av. (SR-83) (#1) – LOS E AM peak hour only
- I-15 Freeway Southbound, South of Limonite Av. (#9) – LOS E AM peak hour only

Existing (2017) basic freeway segment analysis worksheets are provided in Appendix 3.5.

Table 3-2

Roadway Segment Capacity Analysis for Existing (2017) Conditions

#	Roadway	Segment Limits	Roadway Section	LOS Capacity ¹	Existing 2017	V/C ²	LOS ³	Acceptable LOS
1	Merrill Avenue	East of Euclid Av. (SR-83)	2U	14,000	8,407	0.60	B	D
2		Between Grove Av. and Vineyard Av.	2U	14,000	7,466	0.53	A	D
3		West of Driveway 2	2U	14,000	10,754	0.77	C	D
4	Archibald Avenue	North of Ontario Ranch Rd.	4D	35,900	21,177	0.59	A	D
5		Between Eucalyptus Av. and Merrill Av.	4D	35,900	20,073	0.56	A	D
6		North of the County Line	2D	17,950	27,064	1.51	F	D

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

¹ These maximum roadway capacities have been obtained from the City of Ontario's General Plan.

² V/C = Volume to Capacity Ratio

³ LOS = Level of Service

Table 3-3

Peak Hour Freeway Off-Ramp Queuing Summary for Existing (2017) Conditions

Intersection	Movement	Available Stacking Distance (Feet)	95th Percentile Queue (Feet) ³		Acceptable? ¹

	NBR	400	65	237	Yes	Yes

¹ Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

² 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

³ Although 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the SR-60, SR-71, or I-15 Freeway mainline.

Table 3-4

Basic Freeway Segment Analysis for Existing (2017) Conditions

Freeway	Direction ¹	Mainline Segment	Lanes ²	Volume		Truck %		Density ³		LOS ⁴	
				AM	PM	AM	PM	AM	PM	AM	PM

		South of Limonite Av.	3	5,872	5,354	6%	7%	37.4	32.2	E	D
	NB	North of Cantu Galleano Ranch Rd.	5	6,069	5,311	2%	2%	19.1	16.7	C	B
		Cantu Galleano Ranch Rd. to Limonite Av.	3	5,573	4,866	1%	2%	32.7	27.0	D	D
		South of Limonite Av.	3	5,006	5,206	1%	2%	27.8	29.7	D	D

* **BOLD** = Unacceptable Level of Service
¹ NB = Northbound; SB = Southbound, EB = Eastbound; WB = Westbound
² Number of lanes are in the specified direction and is based on existing conditions.
³ Density is measured by passenger cars per mile per lane (pc/mi/ln).
⁴ LOS = Level of Service

EXHIBIT 3-20: EXISTING (2017) FREEWAY MAINLINE VOLUMES (ACTUAL VEHICLES)

LEGEND:

← 100/200 = AM/PM PEAK HOUR VOLUMES
 NOTE: VOLUMES IN ACTUAL VEHICLES (NOT PCE)

3.13 FREEWAY MERGE/DIVERGE ANALYSIS

Ramp merge and diverge operations were also evaluated for Existing (2017) conditions and the results of this analysis are presented in Table 3-5. As shown in Table 3-5, the following merge and diverge areas currently do not operate at LOS D or better during the peak hours under Existing (2017) traffic conditions:

- SR-60 Freeway, Eastbound Off-Ramp at Archibald Av. (#6) – LOS E AM peak hour only
- I-15 Freeway, Southbound On-Ramp at Limonite Av. (#9) – LOS E AM peak hour only
- I-15 Freeway, Northbound On-Ramp at Cantu Galleano Ranch Rd. (#10) – LOS E AM peak hour only

Existing (2017) freeway ramp junction operations analysis worksheets are provided in Appendix 3.6.

3.14 RECOMMENDED IMPROVEMENTS

Improvement strategies have been recommended at intersections, roadway segments, and freeway segments that have been identified as impacted under Existing (2017) traffic conditions in an effort to achieve an acceptable LOS (i.e., LOS D or better).

3.13.1 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES AT INTERSECTIONS

Table 3-6 indicates the physical improvements needed to address LOS deficiencies at each of the study area intersections under Existing (2017) traffic conditions. The following improvements are recommended to improve Existing (2017) deficiencies.

Recommended Improvement – Hellman Av. / Kimball Av. (#10) – The following improvement is necessary to improve the existing deficiency to acceptable levels:

- Install a traffic signal.

Recommended Improvement – Archibald Av. / Limonite Av. (#26) – The following improvement is necessary to improve the existing deficiency to acceptable levels:

- Construct a 2nd southbound left turn lane.

Recommended Improvement – Hamner Av. / Ontario Ranch Rd. (#31) – The intersection of Hamner Avenue and Ontario Ranch Road is currently under construction to widen Hamner Avenue between Ontario Ranch Road/Cantu Galleano Ranch Road and Bellegrave Avenue. It is anticipated that once these improvements are completed (mid to late 2017), the intersection would operate at acceptable LOS during the peak hours and the Project’s cumulative impact at the intersection would be less than significant.

The intersection operations analysis worksheets, with improvements, are included in Appendix 3.7 of this TIA.

Table 3-5

Freeway Ramp Junction Merge/Diverge Analysis for Existing (2017) Conditions

Freeway	Direction ¹	Ramp or Segment	Lanes on Freeway ²	AM Peak Hour		PM Peak Hour	
				Density ³	LOS ⁴	Density ²	LOS ⁴
SR-71	SB	Loop On-Ramp at Euclid Av. (SR-83) (Upstream)	2	33.0	D	29.7	D
		Loop On-Ramp at Euclid Av. (SR-83) (Downstream)	2	33.0	D	29.7	D
	NB	Off-Ramp at Euclid Av. (SR-83)	3	32.3	D	33.9	D
SR-60	WB	On-Ramp at Archibald Av.	4	23.2	C	22.7	C
		Off-Ramp at Archibald Av.	5	28.7	D	25.0	C
	EB	Off-Ramp at Archibald Av.	4	35.1	E	31.3	D
		On-Ramp at Archibald Av.	4	25.8	C	26.2	C
I-15	SB	Off-Ramp at Cantu Galleano Ranch Rd.	4	31.8	D	32.8	D
		On-Ramp at Limonite Av.	3	35.1	E	31.7	D
	NB	On-Ramp at Cantu Galleano Ranch Rd.	3	37.8	E	33.7	D
		Off-Ramp at Limonite Av.	3	32.5	D	34.5	D

* **BOLD** = Unacceptable Level of Service

¹ NB = Northbound; SB = Southbound, EB = Eastbound; WB = Westbound

² Number of lanes are in the specified direction and is based on existing conditions.

³ Density is measured by passenger cars per mile per lane (pc/mi/ln).

⁴ LOS = Level of Service

Table 3-6

Intersection Analysis for Existing (2017) Conditions With Improvements

#	Intersection	Traffic Control ³	Intersection Approach Lanes ¹												Delay ² (secs.)		Level of Service	
			Northbound			Southbound			Eastbound			Westbound			AM	PM	AM	PM
			L	T	R	L	T	R	L	T	R	L	T	R				
10	Hellman Av. / Kimball Av.																	
	- Without Improvements	AWS	1	0	0	0	0	0	0	0	1	0	0	0	98.6	56.2	F	F
	- With Improvements	<u>TS</u>	1	0	0	0	0	0	0	0	1	0	0	0	3.4	1.9	A	A
26	Archibald Av. / Limonite Av.																	
	- Without Improvements	TS	0	1	1>	1	1	0	0	0	0	1	0	1>	40.1	65.5	D	E
	- With Improvements	TS	0	1	1>	<u>2</u>	1	0	0	0	0	1	0	1>	41.7	30.1	D	C
31	Hamner Av. / Ontario Ranch Rd.																	
	- Without Improvements	TS	1	1	0	1	1	0	1	1	1	1	1	1	76.4	59.4	E	E
	- With Improvements ⁴	TS	<u>2</u>	<u>3</u>	<u>1</u>	<u>2</u>	<u>2</u>	<u>1</u>	<u>2</u>	<u>3</u>	1	<u>2</u>	<u>2</u>	1	21.2	19.7	C	B

¹ When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; >> = Free Right Turn Lane; d= Defacto Right Turn Lane; 1 = Improvement

² Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

³ AWS = All-Way Stop; TS = Traffic Signal; TS = Improvement

⁴ Improvements shown are currently under construction and are anticipated to be completed by mid to late 2017.

3.13.2 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON ROADWAY SEGMENTS

As shown on Table 3-7, the segment of Archibald Avenue north of the County Line would accommodate the anticipated daily traffic flows once the section is widened to a four-lane section. This segment would be widened as part of the frontage improvements in conjunction with the development of the proposed Project.

3.13.3 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON OFF-RAMP QUEUES

As shown previously on Table 3-3, there are no peak hour queuing issues at the SR-71 Freeway and Euclid Avenue (SR-83), SR-60 Freeway at Archibald Avenue, I-15 Freeway and Cantu Galleano Ranch Road, or I-15 Freeway and Limonite Avenue interchanges. As such, no improvements have been recommended.

3.13.4 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON FREEWAY FACILITIES

At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development projects in the City of Ontario (or other neighboring jurisdictions) on SHS roadway segments. As such, no improvements have been recommended to address the Existing (2017) deficiencies on the SHS, because there is no feasible mitigation available.

Table 3-7

Roadway Segment Capacity Analysis for Existing (2017) Conditions With Improvements

#	Roadway	Segment Limits	Roadway Section	LOS Capacity ¹	Existing 2017	V/C ²	LOS ³	Acceptable LOS
6	Archibald Avenue	North of the County Line	4D	35,900	27,064	0.75	C	D

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

¹ These maximum roadway capacities have been obtained from the City of Ontario's General Plan.

² V/C = Volume to Capacity Ratio

³ LOS = Level of Service

This Page Intentionally Left Blank

4 PROJECTED FUTURE TRAFFIC

This section presents the traffic volumes estimated to be generated by operation of PA1 and PA2, as well as the Project's trip assignment onto the study area roadway network. The Project is proposed to consist of up to 175,330-sf of manufacturing use (25 percent of Buildings 1 through 8), 525,991-sf of warehousing use (75 percent of Buildings 1 through 8), and 998,680-sf high-cube warehouse/distribution center use (Building 9). Similarly, PA3 would develop consist of up to 57,799-sf of manufacturing use (25 percent of the square footage), 173,396-sf of warehousing use (75 percent of the square footage). Regional access to the project site is provided via the SR-60 Freeway, the SR-71 Freeway, and the I-15 Freeway.

The Project is located on the southwest corner of Archibald Avenue and Merrill Avenue in the City of Ontario. Vehicular and truck traffic access will be provided via the following driveways:

- Driveway 1 / Merrill Avenue – Right-in/right-out driveway providing access to both passenger cars and trucks for Buildings 1, 2, and 9
- Driveway 2 / Merrill Avenue – Full access driveway providing access to both passenger cars and trucks for Buildings 3, 4, 5, 6, and 9
- Archibald Avenue / Driveway 3 – Right-in/right-out driveway providing access to passenger cars and trucks for Buildings 5, 6, and 9
- Archibald Avenue / Driveway 4 – Full access driveway providing access to both passenger cars and trucks for Buildings 6, 7, 8, and 9
- Archibald Avenue / Driveway 5 – Right-in/right-out driveway providing access to passenger cars and trucks for Buildings 8 and 9

4.1 PROJECT TRIP GENERATION

Trip generation represents the amount of traffic which is both attracted to and produced by a development. Determining traffic generation for a specific project is therefore based upon forecasting the amount of traffic that is expected to be both attracted to and produced by the specific land uses being proposed for a given development.

Trip generation rates used to estimate Project traffic are shown in Table 4-1. A summary of the Project's trip generation based on PCE is shown in Table 4-2 while the trip generation based on actual vehicles is shown on Table 4-3 for informational purposes. The trip generation rates used for this analysis are based upon information collected by the ITE as provided in their Trip Generation Manual, 10th Edition, 2017. (3)

¹ TSF = thousand square feet² TOTAL NET TRIPS = Passenger Cars + Net Truck Trips.

For purposes of this analysis, the following ITE land use codes and vehicle mixes have been utilized:

- ITE land use code 140 (Manufacturing) has been used to derive site specific trip generation estimates for up to 25 percent of the total square footage for Buildings 1 through 8. The ITE Trip Generation Manual includes very limited data regarding the types of vehicles that are generated for manufacturing uses (passenger cars and various sizes of trucks). As such, data regarding the vehicle mix has been obtained from a separate report; the City of Fontana Truck Trip Generation Study (August 2003) for the manufacturing uses proposed as part of the Project. Buildings 1 through 8 have been identified as a mix of manufacturing and warehousing uses. The “Light Industrial” vehicle mix data has been utilized as a vehicle mix for manufacturing is not readily available.
- ITE land use code 150 (Warehousing) has been used to derive site specific trip generation estimates for up to 75 percent of the total square footage for Buildings 1 through 8. The ITE Trip Generation Manual includes very limited data regarding the types of vehicles that are generated for warehousing uses (passenger cars and various sizes of trucks). Data regarding the vehicle mix has therefore been obtained from a separate report; the City of Fontana Truck Trip Generation Study (August 2003) for the warehousing use proposed as part of the Project. Buildings 1 through 8 have been identified as a mix of manufacturing and warehousing uses. The “Heavy Warehouse” vehicle mix data has been utilized for the warehouse use.
- ITE land use code 154 (High-Cube Transload and Short-Term Storage Warehouse) has been used to derive site specific trip generation estimates for Building 9. Total vehicle mix percentages were also obtained from the ITE High Cube Warehouse Vehicle Trip Generation Analysis in conjunction with the South Coast Air Quality Management District’s (SCAQMD) recommended truck mix, by axle type. (8) The SCAQMD is currently recommending their truck mix by axle-type to better quantify trip rates associated with local warehouse and distribution projects, as truck emission represent more than 90 percent of air quality impacts from these projects. This recommended procedure has been utilized for the purposes of this analysis in effort to be consistent with other technical studies being prepared for the Project. The ITE High Cube Warehouse Vehicle Trip Generation Analysis shows that the total trucks for high-cube transload warehouses is 31.2%. Trip generation for heavy trucks was further broken down by truck type (or axle type). The total truck percentage is comprised of 3 different truck types: 2-axle, 3-axle, and 4+-axle trucks. For the purposes of this analysis, the percentage of trucks, by axle type, were obtained from the SCAQMD interim recommended truck mix. The SCAQMD has recently performed surveys of existing facilities and compiled the data to provide interim guidance on the mix of heavy trucks for these types of high-cube warehousing/distribution facilities. Based on this interim guidance from the SCAQMD, the following truck fleet mix was utilized for the purposes of estimating the truck trip generation for the site (for without cold storage): 16.7% of the total trucks as 2-axle trucks, 20.7% of the total trucks as 3-axle trucks, and 62.6% of the total trucks as 4+-axle trucks.

Trip generation for heavy trucks was further broken down by truck type (or axle type). The total truck percentage is comprised of 3 different truck types: 2-axle, 3-axle, and 4+-axle trucks. For the purposes of this analysis, the percentage of trucks, by axle type, were obtained from the ITE High Cube Warehouse Vehicle Trip Generation Analysis or the City of Fontana’s Truck Trip Generation Study. (8) (9) Lastly, PCE factors were applied to the trip generation rates for heavy trucks (large 2-axles, 3-axles, 4+-axles). PCEs allow the typical “real-world” mix of vehicle types

to be represented as a single, standardized unit, such as the passenger car, to be used for the purposes of capacity and level of service analyses. The PCE factors are consistent with the recommended PCE factors in Appendix B of the San Bernardino County CMP 2016 Update. Trip generation rates for actual vehicles and with PCE factors are shown on Table 4-1.

As shown on Table 4-2, the proposed Project (Project buildout) is anticipated to generate a net total of 4,109 PCE trip-ends per day, 371 PCE AM peak hour trips and 424 PCE PM peak hour trips for Opening Year Cumulative traffic conditions. The proposed Project is anticipated to generate a net total of 4,782 PCE trip-ends per day, 454 PCE AM peak hour trips and 514 PCE PM peak hour trips with the addition of PA3 for Horizon Year (2040) traffic conditions. In comparison, the proposed Project is anticipated to generate a net total of 3,003 actual vehicle trip-ends per day with 279 AM peak hour trips and 316 PM peak hour trips for Opening Year Cumulative traffic conditions and 3,533 trip-ends per day with 343 AM peak hour trips and 385 PM peak hour trips with the addition of PA3 under Horizon Year (2040) traffic conditions (see Table 4-3).

4.2 PROJECT TRIP DISTRIBUTION

The Project trip distribution and assignment process represents the directional orientation of traffic to and from the Project site. The trip distribution pattern of passenger cars is heavily influenced by the geographical location of the site, the location of surrounding uses, and the proximity to the regional freeway system. The trip distribution pattern for truck traffic is also influenced by the local truck routes approved by the City of Ontario, City of Chino, City of Chino Hills, City of Eastvale, and the California Department of Transportation (Caltrans). Given these differences, separate trip distributions were generated for both passenger cars and truck trips.

The Opening Year Cumulative distribution patterns utilize the existing roadway system in relation to the Horizon Year trip distribution patterns, which assumes future roadway connections. The Project trip distribution patterns are also affected by near-term development patterns in the vicinity of the Project site. The extension of Flight Avenue north of Merrill Avenue, Hellman Avenue north of Merrill Avenue, Carpenter Avenue north of Merrill Avenue, Schaefer Avenue at Archibald Avenue, Limonite Avenue/Kimball Avenue extension between Hellman Avenue and Archibald Avenue, and the Merrill Avenue extension to Bellegrave Avenue will also be assumed for Horizon Year conditions only.

Exhibit 4-1 illustrates the truck trip distribution patterns for Opening Year Cumulative and Horizon Year conditions. As shown on Exhibit 4-1, trucks are anticipated to utilize designated truck routes such as Merrill Avenue, Euclid Avenue (SR-83), Archibald Avenue, Edison Avenue/Ontario Ranch Road, and Limonite Avenue to reach regional freeways such as the SR-71, SR-60, and I-15 Freeways. These travel patterns are not anticipated to change with the addition of new future facilities for Horizon Year traffic conditions.

EXHIBIT 4-1 (10F2): PROJECT (OPENING YEAR CUMULATIVE AND HORIZON YEAR TRUCK) TRIP DISTRIBUTION

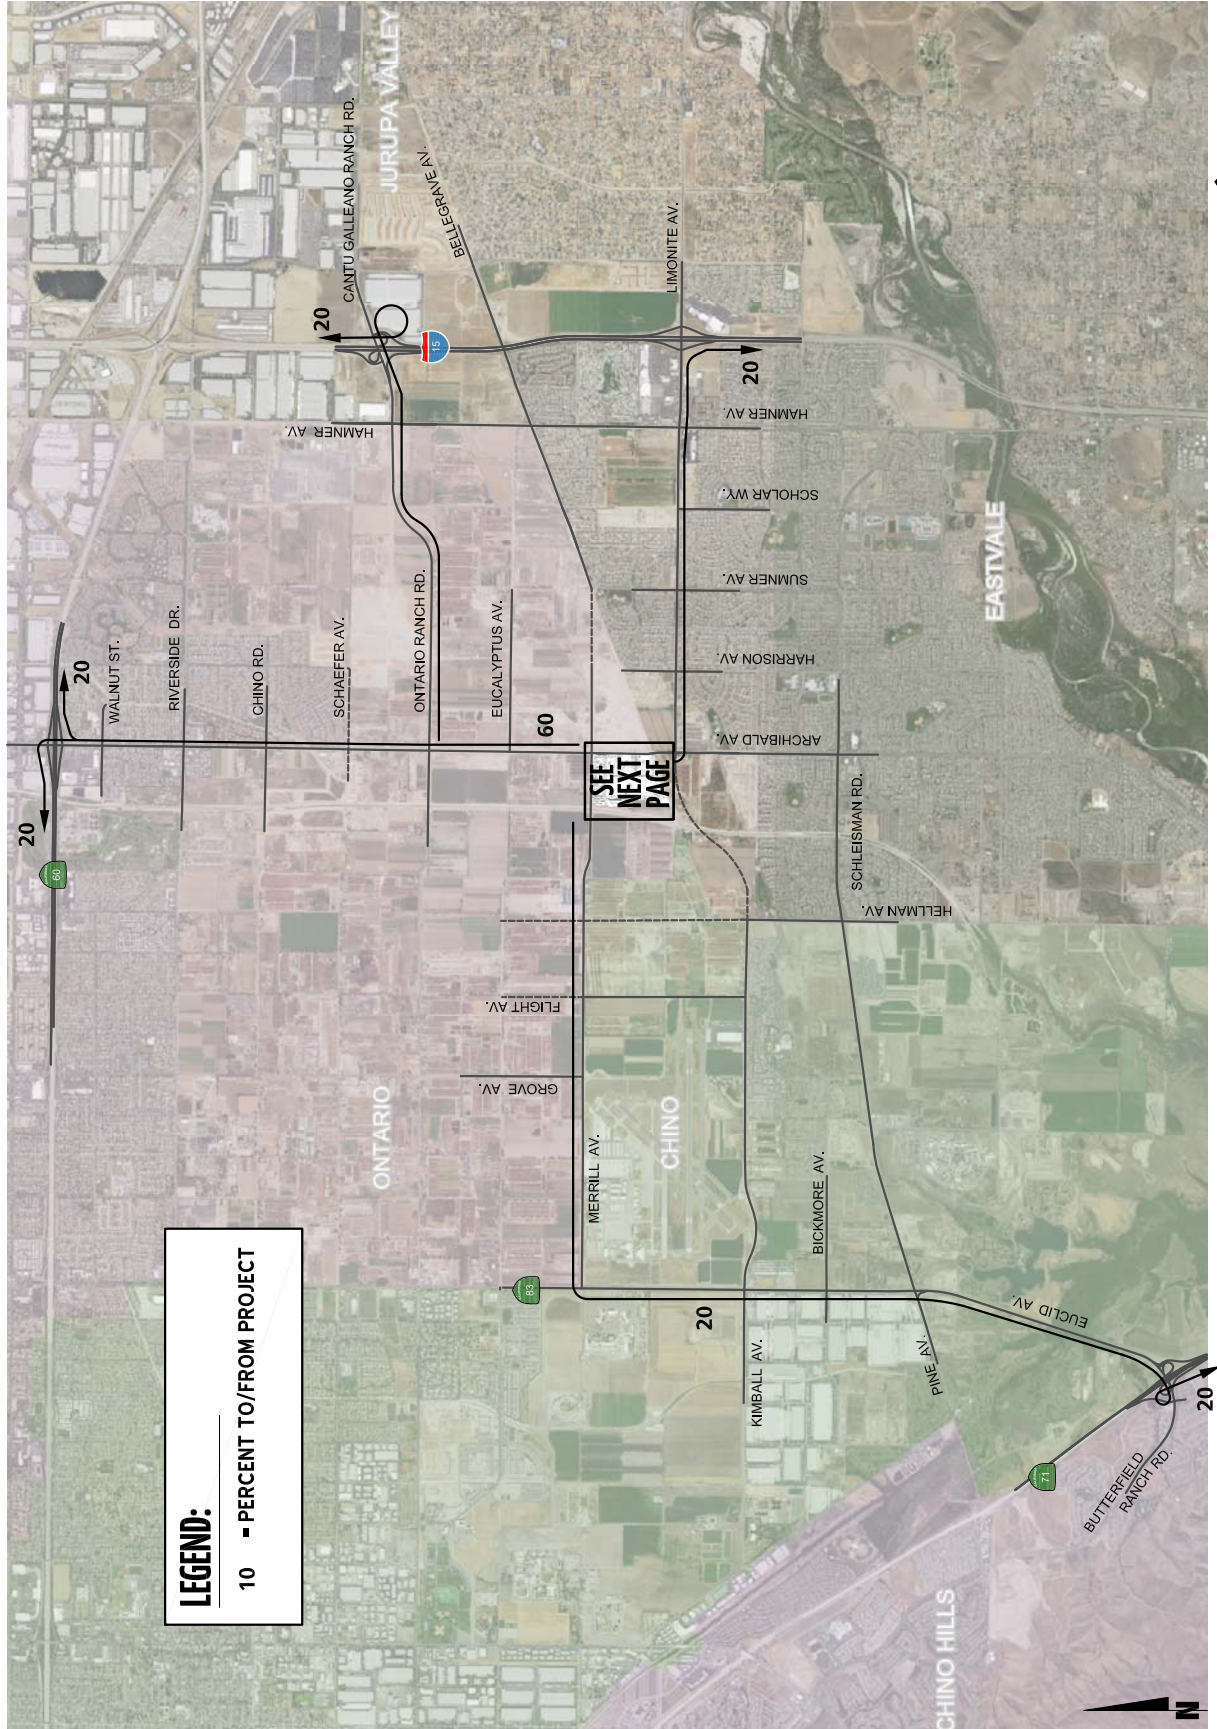

EXHIBIT 4-1 (2OF2): PROJECT (OPENING YEAR CUMULATIVE AND HORIZON YEAR TRUCK) TRIP DISTRIBUTION

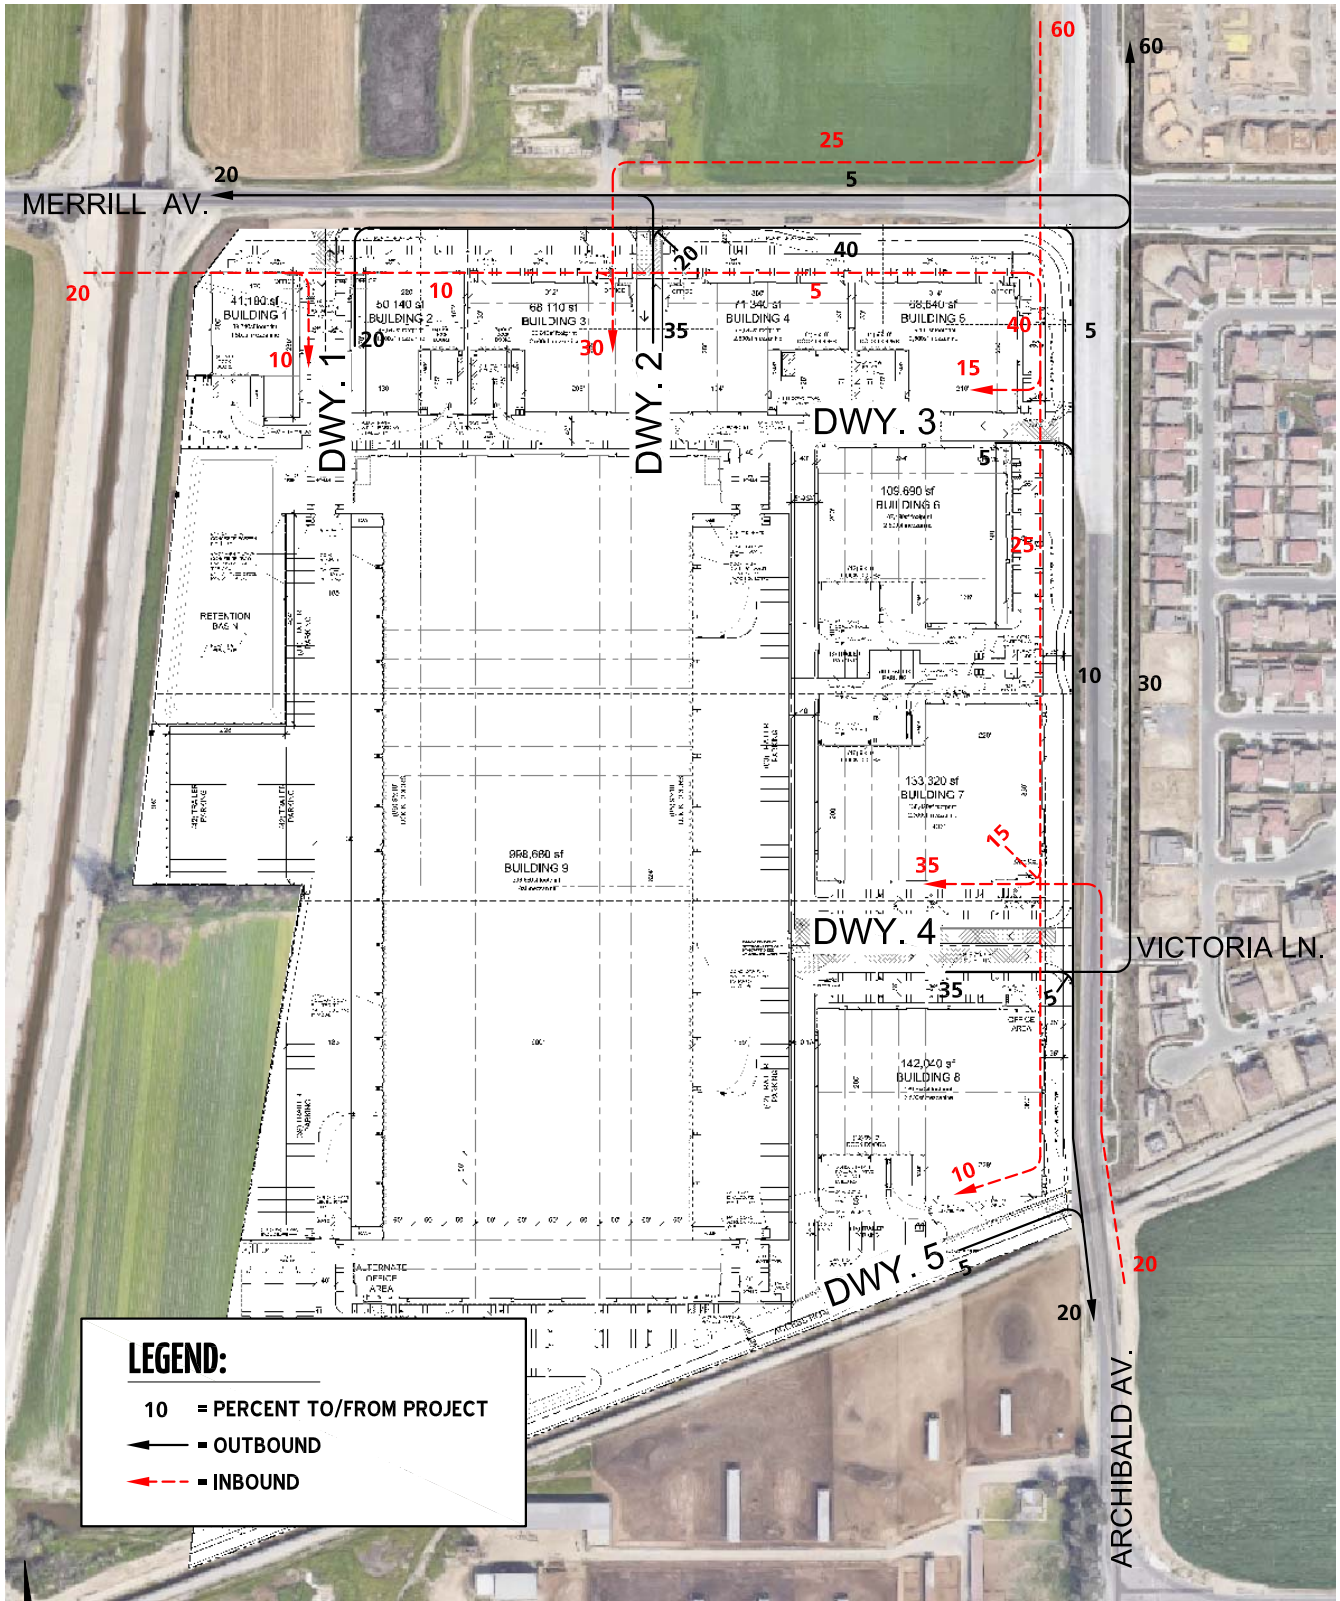

Exhibit 4-2 illustrates the Opening Year Cumulative passenger car trip distribution patterns. The Opening Year Cumulative passenger car trip distribution patterns are based on a SBTAM select zone run for the zone containing the Project, with modifications to utilize the existing roadway system. Exhibit 4-3 illustrates the passenger car trip distribution patterns for Horizon Year traffic conditions. The passenger car trip distribution patterns are based on a SBTAM select zone run for the zone containing the Project.

4.3 MODAL SPLIT

The potential for Project trips (non-truck) to be reduced by the use of public transit, walking or bicycling have not been included as part of the Project's estimated trip generation. Essentially, the Project's traffic projections are "conservative" in that these alternative travel modes would reduce the forecasted traffic volumes (non-truck trips only).

4.4 PROJECT TRIP ASSIGNMENT

The assignment of traffic from the Project area to the adjoining roadway system is based upon the Project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the Project. Based on the identified Project traffic generation and trip distribution patterns, Project ADT and peak hour intersection turning movement volumes are shown on Exhibits 4-4 and 4-5 for near-term traffic conditions, and Project ADT and peak hour intersection turning movement volumes are shown on Exhibits 4-6 and 4-7 for Horizon Year (2040) traffic conditions.

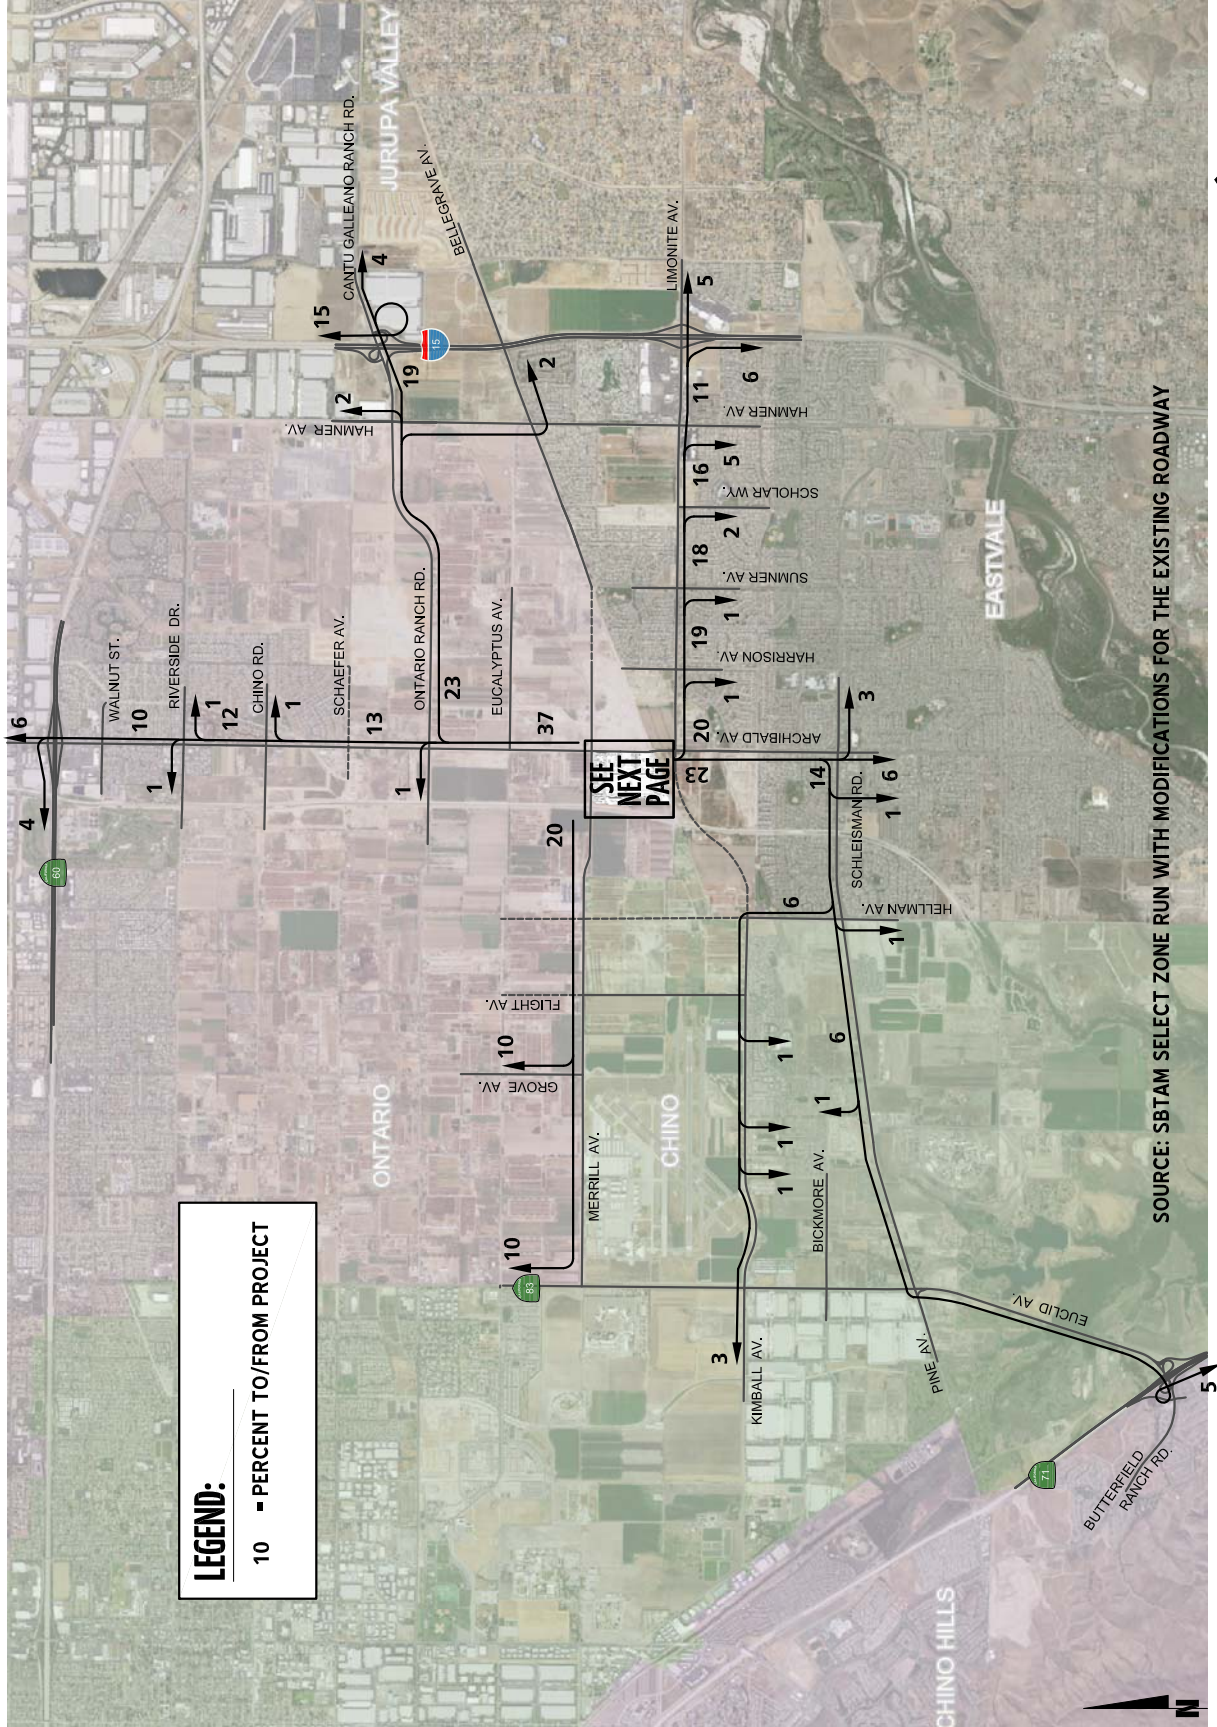

4.5 BACKGROUND TRAFFIC

4.5.1 OPENING YEAR CUMULATIVE CONDITIONS

Future year traffic forecasts have been based upon background (ambient) growth at 2% per year for 2019 traffic conditions. The ambient growth factor is intended to approximate regional traffic growth. The total ambient growth is 2.0% for 2019 traffic conditions (growth of 2.0 percent per year over 1 year). This ambient growth rate is added to existing traffic volumes to account for area-wide growth not reflected by cumulative development projects. Ambient growth has been added to daily and peak hour traffic volumes on surrounding roadways, in addition to traffic generated by the development of future projects that have been approved but not yet built and/or for which development applications have been filed and are under consideration by governing agencies.

Opening Year Cumulative (2019) traffic volumes are provided in Section 6 *Opening Year Cumulative (2019)* of this report. The traffic generated by the proposed Project was then manually added to the base volume to determine Opening Year Cumulative "With Project" forecasts for 2019.

4.5.2 HORIZON YEAR (2040) CONDITIONS

The adopted *Southern California Association of Governments (SCAG) 2016 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)* (April 2016) growth forecasts for the City of Ontario identifies projected growth in population of 166,300 in 2012 to 258,600 in 2040, or a 55.50% increase over the 28-year period. (10) The change in population equates to roughly a 1.59% growth rate, compounded annually. Similarly, growth over the same 28-year period in households is projected to increase by 66.96%, or a 1.85% annual growth rate. Finally, growth in employment over the same 28-year period is projected to increase by 69.80%, or a 1.91% annual growth rate.

Based on a comparison of Existing (2017) traffic volumes to the Horizon Year (2040) forecasts, the average growth rate is estimated at approximately 2.75%, compounded annually between Existing (2017) and 2040 traffic conditions. The annual growth rate at each individual intersection is not lower than 0.60% compounded annually to as high as 5.89% compounded annually over the same time period.

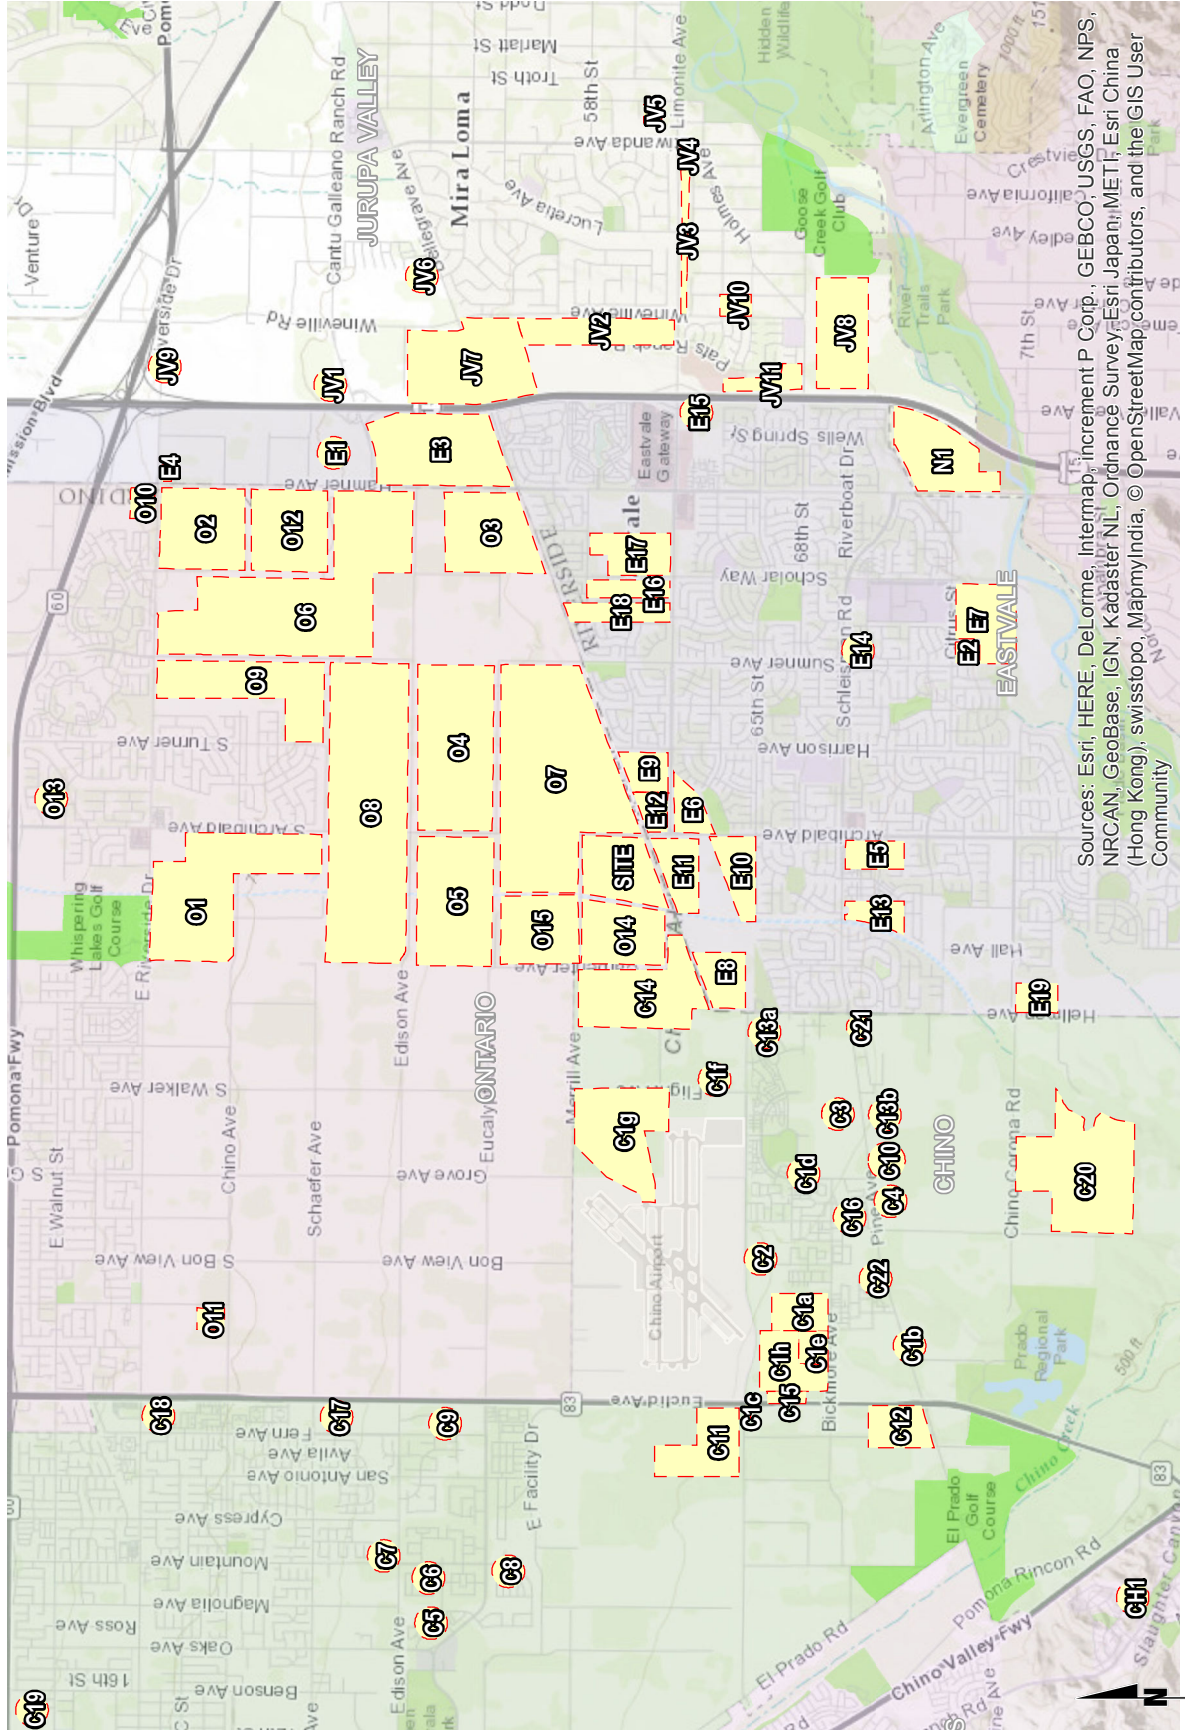

Therefore, the annual growth rate utilized for the purposes of this analysis would appear to conservatively approximate the anticipated regional growth in traffic volumes in the City of Ontario for Opening Year Cumulative and Horizon Year (2040) traffic conditions, especially when considered along with the addition of project-related traffic. As such, the growth in traffic volumes assumed in this traffic impact analysis would tend to overstate as opposed to understate the potential impacts to traffic and circulation. Horizon Year (2040) With Project traffic forecasts reflects buildout of the Project (i.e., traffic associated with PA1, PA2, and PA3).

4.6 CUMULATIVE DEVELOPMENT TRAFFIC

California Environmental Quality Act (CEQA) guidelines require that other reasonably foreseeable development projects which are either approved or being processed concurrently in the study area also be included as part of a cumulative analysis scenario. A cumulative project list was developed for the purposes of this analysis through consultation with planning and engineering staff from the City of Ontario. The neighboring jurisdictions of Chino, Eastvale, and Jurupa Valley have also been contacted to include key projects in their respective cities.

Exhibit 4-8 illustrates the cumulative development location map. A summary of cumulative development projects and their proposed land uses are shown on Table 4-4. If applicable, the traffic generated by individual cumulative projects was manually added to the Opening Year Cumulative forecasts to ensure that traffic generated by the listed cumulative development projects in Table 4-4 are reflected as part of the background traffic. Cumulative ADT and peak hour intersection turning movement volumes are shown on Exhibits 4-9 and 4-10 for near-term traffic conditions.

4.7 HORIZON YEAR (2040) VOLUME DEVELOPMENT

Traffic projections for Horizon Year (2040) without Project conditions were derived from the San Bernardino Transportation Analysis Model (SBTAM) using accepted procedures for model forecast refinement and smoothing for study area intersections located within the County of San Bernardino. The current version of the SBTAM reflects the local input in the adopted 2016 SCAG RTP within the County of San Bernardino.

The traffic forecasts reflect the area-wide growth anticipated between Existing (2017) conditions and Horizon Year (2040) traffic conditions. In most instances the traffic model zone structure is not designed to provide accurate turning movements along arterial roadways unless refinement and reasonableness checking is performed. Therefore, the Horizon Year (2040) peak hour forecasts were refined using the model derived long range forecasts, base (validation) year model forecasts, along with existing peak hour traffic count data collected at each analysis location in April and December of 2016. The SBTAM has a base (validation) year of 2012 and a horizon (future forecast) year of 2040. The difference in model volumes (2040-2012) defines the growth in traffic over the 28-year period. The Riverside Transportation Analysis Model (RivTAM) has a base (validation) year of 2008 and a horizon (future forecast) year of 2035. The RivTAM 2035 model utilized for the purposes of this analysis assumes buildout of the City of Eastvale. A compounded growth rate consistent with the SCAG RTP/SCS has been applied to the Eastvale locations to determine 2040 forecasts.

The refined future peak hour approach and departure volumes obtained from the model output data are then entered into a spreadsheet program consistent with the National Cooperative Highway Research Program (NCHRP Report 255), along with initial estimates of turning movement proportions. A linear programming algorithm is used to calculate individual turning movements which match the known directional roadway segment forecast volumes computed in the previous step. This program computes a likely set of intersection turning movements from intersection approach counts and the initial turning proportions from each approach leg.

The SBTAM uses an AM peak period-to-peak hour factor of 0.35 and a PM peak period-to-peak hour factor of 0.28. These factors represent the relationship of the highest single AM peak hour to the modeled 3 hour AM peak period (an even distribution would result in a factor of 0.33) and the highest single PM peak hour to the modeled 4 hour PM peak period (an even distribution would result in a factor of 0.25). The model data from RivTAM represents peak hour data and therefore did not require adjustments.

Typically, the model growth is prorated and is subsequently added to the existing (base validation) traffic volumes to represent Horizon Year traffic conditions. In an effort to conduct a conservative analysis, reductions to traffic forecasts from either Existing or Opening Year Cumulative traffic conditions were not assumed as part of this analysis. As such, in conjunction with the addition of cumulative projects that are not consistent with the General Plan, additional growth has also been applied on a movement-by-movement basis, where applicable, to estimate reasonable Horizon Year (2040) forecasts. Horizon Year (2040) turning volumes were compared to Opening Year Cumulative (2019) volumes in order to ensure a minimum growth as a part of the refinement process. The minimum growth includes any additional growth between Opening

Year Cumulative (2019) and Horizon Year (2040) traffic conditions that is not accounted for by the traffic generated by cumulative development projects and ambient growth rates assumed between Existing (2017) and Opening Year Cumulative (2019) conditions. Adjustments have not been made to study area intersections that may be affected by new future roadway connections (such as the extension of Limonite Avenue), where travel patterns would likely get affected and forecasts may potentially decrease from the Opening Year cumulative conditions. Future estimated peak hour traffic data was used for new intersections and intersections with an anticipated change in travel patterns to further refine the Horizon Year (2040) peak hour forecasts.

The future Horizon Year (2040) without Project peak hour turning movements were then reviewed by Urban Crossroads, Inc. for reasonableness, and in some cases, were adjusted to achieve flow conservation, reasonable growth, and reasonable diversion between parallel routes. Flow conservation checks ensure that traffic flow between two closely spaced intersections, such as two adjacent driveway locations, is verified to make certain that vehicles leaving one intersection are entering the adjacent intersection and that there is no unexplained loss of vehicles. The result of this traffic forecasting procedure is a series of traffic volumes which are suitable for traffic operations analysis.

The SBTAM and RivTAM do not include a truck component or have data that is unusually low. As such, in an effort to conduct a conservative analysis, the presence of trucks has been accounted for based on the manual volume adjustments made to demonstrate growth above Opening Year Cumulative (2019) traffic forecasts, which are presented and evaluated in PCE (see Section 3.6 *Existing Traffic Counts* for discussion on PCE). As such, the Horizon Year (2040) forecasts are also assumed to be in PCE for the purposes of this analysis. Horizon Year (2040) With Project traffic forecasts reflects buildout of the Project (i.e., traffic associated with PA1, PA2, and PA3). Post-processing worksheets for Horizon Year (2040) without Project traffic conditions are provided in Appendix 4.1.

This Page Intentionally Left Blank

5 E+P TRAFFIC CONDITIONS

This section discusses the traffic forecasts for Existing plus Project (E+P) conditions and the resulting intersection operations, freeway mainline operations, and traffic signal warrant analyses.

5.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for E+P conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for E+P conditions only (e.g., intersection and roadway improvements at the Project's frontage and driveways).

5.2 EXISTING PLUS PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes Existing traffic volumes plus Project traffic. The ADT volumes which can be expected for E+P traffic conditions are shown on Exhibit 5-1. E+P weekday AM and PM peak hour intersection turning movement volumes are shown on Exhibit 5-2.

5.3 INTERSECTION OPERATIONS ANALYSIS

E+P peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 *Methodologies* of this TIA. The intersection analysis results are summarized in Table 5-1, which indicates there are no additional study area intersections anticipated to operate at unacceptable LOS with the addition of Project traffic, in addition to those identified previously for Existing traffic conditions.

Consistent with Table 5-1, a summary of the peak hour intersection LOS for E+P conditions is shown on Exhibit 5-3. The intersection operations analysis worksheets for E+P traffic conditions are included in Appendix 5.1 of this TIA.

5.4 ROADWAY SEGMENT CAPACITY ANALYSIS

As noted previously, the City of Ontario stated roadway segment capacities are approximate figures only, and are used at the General Plan level to assist in determining the roadway functional classification (number of through lanes) needed to meet future traffic demand. Table 5-2 provides a summary of the E+P conditions roadway segment capacity analysis based on the City of Ontario General Plan Roadway Segment Capacity Thresholds identified previously on Table 2-3. As shown on Table 5-2, there are no additional roadway segments anticipated to operate at an unacceptable LOS under E+P traffic conditions, in addition to those previously identified under Existing (2017) traffic conditions.

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

¹ Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

² CSS = Cross-street Stop; AWS = All-Way Stop; TS = Traffic Signal; **CSS** = Improvement

³ Impact is significant if the pre-project condition is at or better than LOS D (or acceptable LOS) and the project-generated traffic causes deterioration below acceptable levels, a deficiency is deemed to occur. However, if the pre-project condition is already below LOS D (or acceptable LOS), the Project will be responsible for mitigating its impact to a LOS equal to or better than it was without the Project.

Table 5-2

Roadway Segment Capacity Analysis for E+P Conditions

#	Roadway	Segment Limits	Roadway Section	LOS Capacity ¹	Existing 2017	V/C ²	LOS ³	E+P	V/C ²	LOS ³	Acceptable LOS
1	Merrill Avenue	East of Euclid Av. (SR-83)	2U	14,000	8,407	0.60	B	9,005	0.64	B	D
2		Between Grove Av. and Vineyard Av.	2U	14,000	7,466	0.53	A	8,288	0.59	A	D
3		West of Driveway 2	2U	14,000	10,754	0.77	C	11,668	0.83	D	D
4	Archibald Avenue	North of Ontario Ranch Rd.	4D	35,900	21,177	0.59	A	22,216	0.62	B	D
5		Between Eucalyptus Av. and Merrill Av.	4D	35,900	20,073	0.56	A	22,023	0.61	B	D
6		North of the County Line	2D	17,950	27,064	1.51	F	28,401	1.58	F	D

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

¹ These maximum roadway capacities have been obtained from the City of Ontario's General Plan.

² V/C = Volume to Capacity Ratio

³ LOS = Level of Service

5.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

The intersection of Archibald Avenue at Driveway 4 is anticipated to warrant a traffic signal under E+P traffic conditions in addition to those previously warranted under Existing (2017) traffic conditions (see Appendix 5.2).

5.6 OFF-RAMP QUEUING ANALYSIS

Queuing analysis findings for E+P are presented in Table 5-3. As shown on Table 5-3, there are no movements that are currently experiencing queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows with the addition of Project traffic. Worksheets for E+P traffic conditions off-ramp queuing analysis are provided in Appendix 5.3.

5.7 BASIC FREEWAY SEGMENT ANALYSIS

E+P mainline directional volumes for the AM and PM peak hours are provided on Exhibit 5-4. As shown on Table 5-4, no additional freeway segments analyzed for this TIA are were found to operate at an unacceptable LOS (i.e., LOS E or worse) during the peak hours for E+P traffic conditions, in addition to those previously identified under Existing traffic conditions. E+P basic freeway segment analysis worksheets are provided in Appendix 5.4.

5.8 FREEWAY MERGE/DIVERGE ANALYSIS

Ramp merge and diverge operations were also evaluated for E+P conditions and the results of this analysis are presented in Table 5-5. As shown in Table 5-5, there are no additional merge and diverge areas that currently operate at LOS E or LOS F for E+P in addition to those previously listed under Existing traffic conditions. E+P freeway ramp junction operations analysis worksheets are provided in Appendices 5.5.

Table 5-3

Peak Hour Freeway Off-Ramp Queuing Summary for E+P Conditions

Intersection	Movement	Available Stacking Distance (Feet)	Existing (2017)				E+P

¹ Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

² 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

³ Although 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the SR-60, SR-71, or I-15 Freeway mainline.

5.9 PROJECT IMPACTS AND RECOMMENDED IMPROVEMENTS

This section provides a summary of Project impacts and recommended improvements. Based on the City of Ontario significance criteria discussed in Section 2.9 *Thresholds of Significance*, the following intersections were found to be impacted by Project. Improvements necessary to reduce project-related traffic impacts to less than significant are also discussed below.

5.9.1 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES AT INTERSECTIONS

The effectiveness of the proposed recommended mitigation measures is presented in Table 5-6 for E+P traffic conditions. With the implementation of the intersection mitigation measures discussed below, there are no project-related impacts anticipated to the study area intersections. The intersection operations analysis worksheets for E+P traffic conditions, with improvements, are included in Appendix 5.6 of this TIA.

Hellman Avenue / Kimball Avenue (#10) – Although this intersection was found to operate at an unacceptable LOS (LOS F) during the peak hours under Existing traffic conditions, the intersection is anticipated to continue to operate at unacceptable levels during the peak hours with the addition of Project traffic. However, the Project is anticipated to contribute less than 50 peak hour trips (City of Chino’s significance criteria) and the delay is anticipated to increase by less than 5.0 seconds (City of Eastvale’s significance criteria). As such, the impact is considered less than significant.

Impact 1.1 – Archibald Avenue / Limonite Avenue (#26) – Although this intersection was found to operate at an unacceptable LOS (LOS E) during the PM peak hour under Existing traffic conditions, the intersection is anticipated to continue to operate at unacceptable levels during the peak hours with the addition of Project traffic. As such, the impact is considered cumulatively significant (Cumulative Impact 1.1).

Mitigation Measure 1.1 – Archibald Avenue / Limonite Avenue (#26) – The following improvement is necessary to reduce the Project’s proportionate increase in delay to pre-project levels or better, thus reducing the Project’s cumulative impact to less than significant:

- Construct a 2nd southbound left turn lane. The Project should contribute their fair share towards the implementation of this improvement to reduce the Project’s cumulative impact to less than significant.

Impact 2.1 – Hamner Avenue / Ontario Ranch Road (#31) – Although this intersection was found to operate at an unacceptable LOS (LOS F) during the AM and PM peak hours under Existing traffic conditions, the intersection is anticipated to continue to operate at unacceptable levels during both peak hours with the addition of Project traffic. As such, the impact is considered cumulatively significant (Cumulative Impact 2.1).

¹ When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; >> = Free Right Turn Lane; d = Defacto Right Turn Lane; 1 = Improvement

² Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (o movements sharing a single lane) are shown.

³ CSS = Cross-street Stop; AWS = All-Way Stop; TS = Traffic Signal; TS = Improvement

⁴ Mitigation measure consists of fair share contribution towards the improvements (as the same improvements are required for existing conditions).

⁵ Improvements shown are currently under construction and are anticipated to be completed by mid to late 2017.

Mitigation Measure 2.1 – Hamner Avenue / Ontario Ranch Road (#31) – It should be noted that the intersection of Hamner Avenue and Ontario Ranch Road is currently under construction to widen Hamner Avenue between Ontario Ranch Road/Cantu Galleano Ranch Road and Bellegrave Avenue. It is anticipated that once these improvements are completed (mid to late 2017), the intersection would operate at acceptable LOS during the peak hours and the Project’s cumulative impact at the intersection would be less than significant.

5.9.2 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON ROADWAY SEGMENTS

As shown on Table 5-7, the segment of Archibald Avenue north of the County Line would accommodate the anticipated daily traffic flows once the section is widened to a four-lane section. This segment would be widened as part of frontage improvements in conjunction with the development of the proposed Project.

5.9.3 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON OFF-RAMP QUEUES

As shown previously on Table 5-3, there are no peak hour queuing issues at SR-71 Freeway and Euclid Avenue (SR-83), SR-60 Freeway and Archibald Avenue, I-15 Freeway and Cantu Galleano Ranch Road, and I-15 Freeway and Limonite Avenue interchanges. As such, no improvements have been recommended.

5.9.4 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON FREEWAY FACILITIES

At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development projects in the City of Ontario (or other neighboring jurisdictions) on SHS roadway segments. As such, no improvements have been recommended to address the E+P deficiencies on the SHS, because there is no feasible mitigation available.

Table 5-7

Roadway Segment Capacity Analysis for E+P Conditions With Improvements

#	Roadway	Segment Limits	Roadway Section	LOS Capacity ¹	Existing 2017	V/C ²	LOS ³	E+P	V/C ²	LOS ³	Acceptable LOS
6	Archibald Avenue	North of the County Line	4D	35,900	27,064	0.75	C	28,401	0.79	C	D

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

¹ These maximum roadway capacities have been obtained from the City of Ontario's General Plan.

² V/C = Volume to Capacity Ratio

³ LOS = Level of Service

This Page Intentionally Left Blank

6 OPENING YEAR CUMULATIVE (2019) TRAFFIC CONDITIONS

This section discusses the methods used to develop Opening Year Cumulative (2019) Without and With Project traffic forecasts, and the resulting intersection operations, freeway mainline operations, and traffic signal warrant analyses.

6.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for Opening Year Cumulative (2019) conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for Opening Year Cumulative conditions only (e.g., intersection and roadway improvements along the Project's frontage and driveways).
- Driveways and those facilities assumed to be constructed by cumulative developments to provide site access are also assumed to be in place for Opening Year Cumulative conditions only (e.g., intersection and roadway improvements along the cumulative development's frontages and driveways such as the northern extension of Meadow Valley Avenue on Kimball Avenue and the northern extension of Hellman Avenue north of Kimball Avenue).

6.2 OPENING YEAR CUMULATIVE (2019) WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes Existing traffic volumes plus an ambient growth factor of 1.02% plus traffic from pending and approved but not yet constructed known development projects in the area. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Opening Year Cumulative (2019) Without Project traffic conditions are shown on Exhibits 6-1 and 6-2, respectively.

6.3 OPENING YEAR CUMULATIVE (2019) WITH PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes Opening Year Cumulative (2019) Without Project traffic in conjunction with the addition of Project traffic. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Opening Year Cumulative (2019) With Project traffic conditions are shown on Exhibits 6-3 and 6-4, respectively.

6.4 INTERSECTION OPERATIONS ANALYSIS

6.4.1 OPENING YEAR CUMULATIVE (2019) WITHOUT PROJECT TRAFFIC CONDITIONS

LOS calculations were conducted for the study intersections to evaluate their operations under Opening Year Cumulative (2019) Without Project conditions with roadway and intersection geometrics consistent with Section 6.1 *Roadway Improvements*. As shown in Table 6-1, the following additional study area intersections are anticipated to operate at an unacceptable LOS under Opening Year Cumulative (2019) Without Project traffic conditions, in addition to the locations previously identified under Existing traffic conditions:

- Euclid Av. (SR-83) / Merrill Av. (#1) – LOS F AM and PM peak hours
- Euclid Av. (SR-83) / Kimball Av. (#2) – LOS F AM and PM peak hours
- Euclid Av. (SR-83) / Bickmore Av. (#3) – LOS E AM and PM peak hours
- Euclid Av. (SR-83) / Pine Av. (#4) – LOS E AM and PM peak hours
- SR-71 Southbound Ramps / Euclid Av. (SR-83) (#6) – LOS E AM peak hour only
- Grove Av. / Merrill Av. (#7) – LOS F AM and PM peak hours
- Flight Av. / Merrill Av. (#8) – LOS F AM and PM peak hours
- Hellman Av. / Merrill Av. (#9) – LOS F AM peak hour; LOS E PM peak hour
- Hallman Av. / Pine Av. (#11) – LOS E PM peak hour only
- Archibald Av. / SR-60 WB Ramps (#14) – LOS F AM peak hour; LOS E PM peak hour
- Archibald Av. / Riverside Dr. (#17) – LOS F AM and PM peak hours
- Archibald Av. / Schaefer Av. (#19) – LOS F AM and PM peak hours
- Archibald Av. / Ontario Ranch Rd. (#20) – LOS F AM peak hour only
- Archibald Av. / Merrill Av. (#22) – LOS F AM and PM peak hours
- Archibald Av. / Limonite Av. (#26) – LOS F AM and PM peak hours
- Archibald Av. / Schleisman Rd. (#27) – LOS E PM peak hour only
- Harrison Av. / Limonite Av. (#28) – LOS E AM peak hour only
- Hamner Av. / Ontario Ranch Rd. (#31) – LOS E AM peak hour only
- Hamner Av. / Limonite Av. (#33) – LOS E PM peak hour only
- I-15 Southbound Ramps / Limonite Av. (#35) – LOS E AM peak hour only

A summary of the peak hour intersection LOS for Opening Year Cumulative (2019) Without Project conditions is shown on Exhibit 6-5. The intersection operations analysis worksheets for Opening Year Cumulative (2019) Without Project traffic conditions are included in Appendix 6.1 of this TIA.

Table 6-1

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

¹ Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

² CSS = Cross-street Stop; AWS = All-Way Stop; TS = Traffic Signal; CSS = Improvement

³ Improvements currently under construction and anticipated to be completed by mid to late 2017 have been assumed to be in place.

EXHIBIT 6-5: SUMMARY OF LOS FOR OPENING YEAR CUMULATIVE (2019) WITHOUT PROJECT CONDITIONS

6.4.2 OPENING YEAR CUMULATIVE (2019) WITH PROJECT TRAFFIC CONDITIONS

As shown on Table 6-1 and illustrated on Exhibit 6-6, there are no additional study area intersections anticipated to experience unacceptable LOS with the addition of Project traffic during the peak hours. The intersection operations analysis worksheets for Opening Year Cumulative (2019) With Project traffic conditions are included in Appendix 6.2 of this TIA.

6.5 ROADWAY SEGMENT CAPACITY ANALYSIS

As noted previously, the roadway segment capacities are approximate figures only, and are typically used at the General Plan level to assist in determining the roadway functional classification (number of through lanes) needed to meet future forecasted traffic demand.

Table 6-2 provides a summary of the Opening Year Cumulative (2019) conditions roadway segment capacity analysis based on the City of Ontario General Plan Roadway Segment Capacity Thresholds identified previously on Table 2-3. As shown on Table 6-2, all of the study area roadway segments are anticipated to operate at unacceptable LOS (based on daily roadway segment capacities) under Opening Year Cumulative (2019) Without and With Project traffic conditions.

A peak hour assessment of intersections located on either side of a deficient roadway segment has been conducted to determine if peak hour traffic flows can be accommodated by the potentially deficient roadway segment. If it is determined that peak traffic flows can be accommodated at the City's stated LOS thresholds, then roadway segment widening is typically not recommended.

6.6 TRAFFIC SIGNAL WARRANTS ANALYSIS

Hellman Avenue and Merrill Avenue is anticipated to warrant a traffic signal under Opening Year Cumulative (2019) Without Project traffic conditions in addition to those previously warranted under Existing and E+P traffic conditions. The intersection of Driveway 2 and Merrill Avenue is anticipated to meet planning level (ADT) volume based traffic signal warrants for Opening Year Cumulative (2019) With Project traffic conditions in addition to those previously warranted under Opening Year Cumulative (2019) Without traffic conditions (see Appendices 6.3 and 6.4).

6.7 OFF-RAMP QUEUING ANALYSIS

Queuing analysis findings for Opening Year Cumulative (2019) Without and With Project traffic conditions are shown in Table 6-3. As shown on Table 6-3, there are no movements that are anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows with the addition of Project traffic. Worksheets for Opening Year Cumulative (2019) Without and With Project traffic conditions off-ramp queuing analysis are provided in Appendices 6.5 and 6.6, respectively.

EXHIBIT 6-6: SUMMARY OF LOS FOR OPENING YEAR CUMULATIVE (2019) WITH PROJECT CONDITIONS

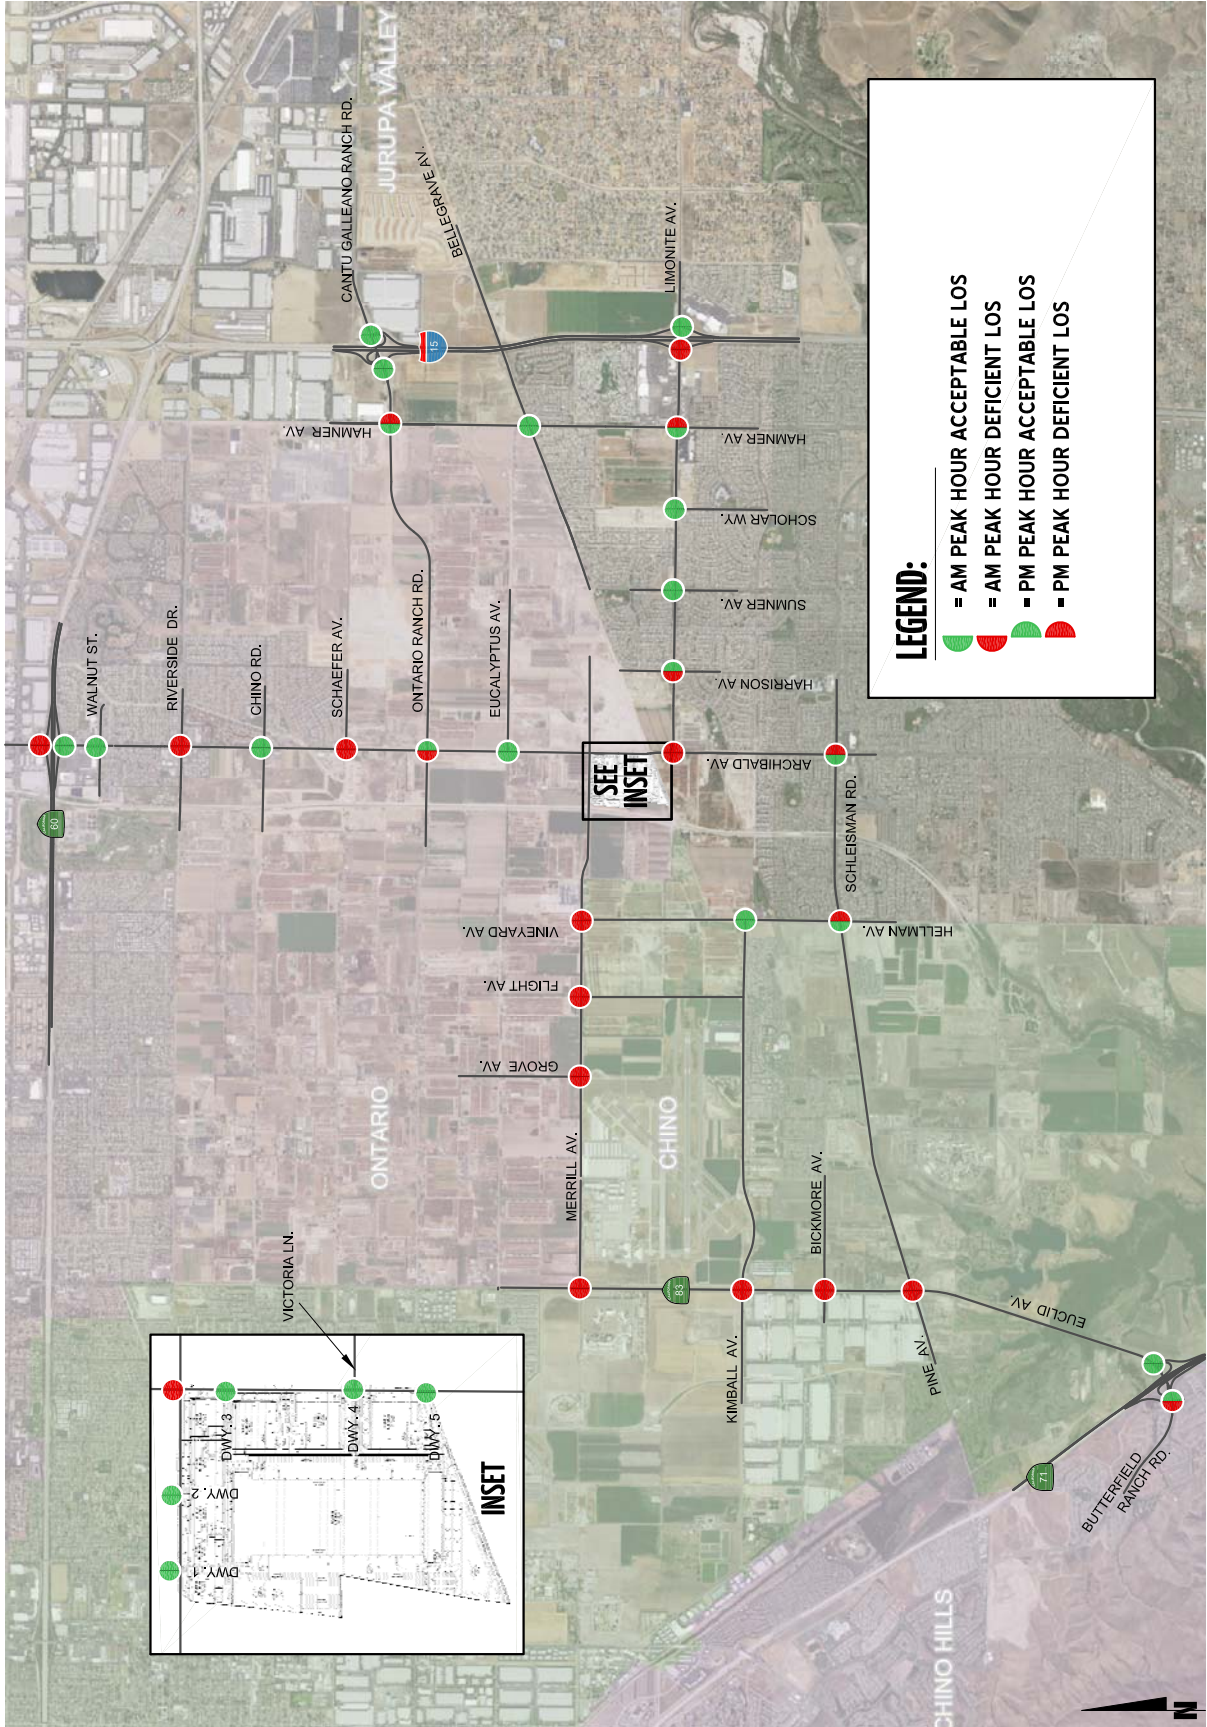

Table 6-2

Roadway Segment Capacity Analysis for Opening Year Cumulative (2019) Conditions

#	Roadway	Segment Limits	Roadway Section	LOS Capacity ¹	2019 Without Project	V/C ²	LOS ³	2019 With Project	V/C ²	LOS ³	Acceptable LOS
1		East of Euclid Av. (SR-83)	2U	14,000	18,516	1.32	F	19,114	1.37	F	D
2	Merrill Avenue	Between Grove Av. and Vineyard Av.	2U	14,000	19,912	1.42	F	20,734	1.48	F	D
3		West of Driveway 2	2U	14,000	26,376	1.88	F	27,290	1.95	F	D
4		North of Ontario Ranch Rd.	4D	35,900	36,227	1.01	F	37,266	1.04	F	D
5	Archibald Avenue	Between Eucalyptus Av. and Merrill Av.	4D	35,900	39,133	1.09	F	41,083	1.14	F	D
6		North of the County Line	2D	17,950	46,665	2.60	F	48,002	2.67	F	D

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

¹ These maximum roadway capacities have been obtained from the City of Ontario's General Plan.

² V/C = Volume to Capacity Ratio

³ LOS = Level of Service

¹ Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

² 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

³ Although 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the SR-60, SR-71, or I-15 Freeway mainline.

6.8 BASIC FREEWAY SEGMENT ANALYSIS

Opening Year Cumulative (2019) Without and With Project mainline directional volumes for the AM and PM peak hours are provided on Exhibits 6-7 and 6-8, respectively. As shown on Table 6-4, the following additional freeway segments are anticipated to operate at an unacceptable LOS (i.e., LOS E or worse) during the peak hours for both Opening Year cumulative (2019) Without and With Project conditions, in addition to those previously identified under Existing and E+P traffic conditions:

- I-15 Freeway Southbound, Cantu Galleano Ranch Rd. to Limonite Av. (#8) – LOS E AM and PM peak hours
- I-15 Freeway Northbound, Cantu Galleano Ranch Rd. to Limonite Av. (#11) – LOS E AM peak hour only
- I-15 Freeway Northbound, South of Limonite Av. (#12) – LOS E AM and PM peak hours

Opening Year Cumulative (2019) Without and With Project basic freeway segment analysis worksheets are provided in Appendix 6.7 and 6.8, respectively.

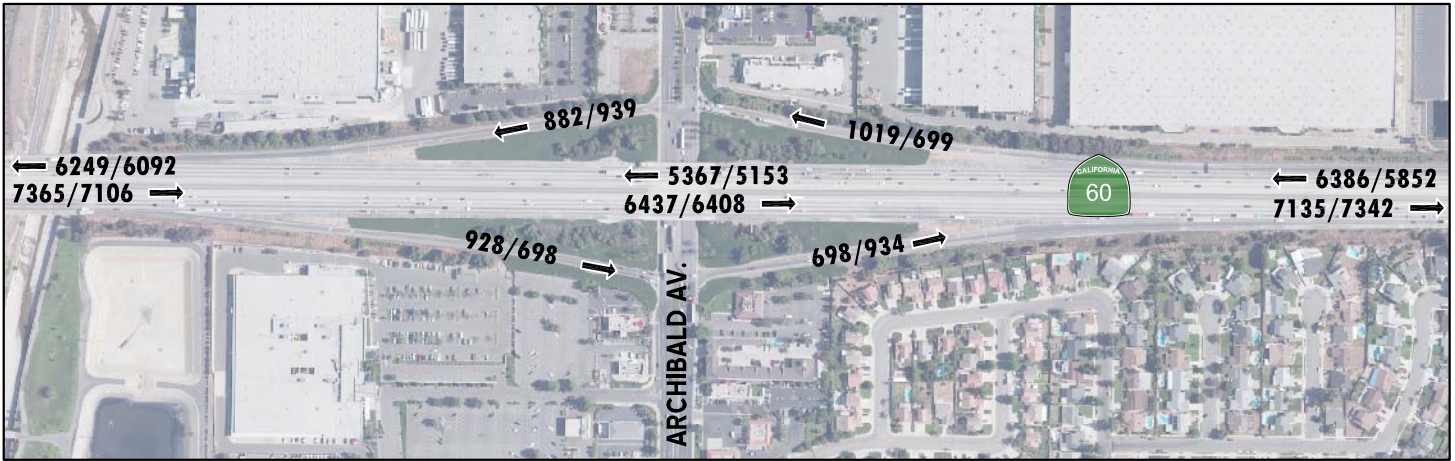

6.9 FREEWAY MERGE/DIVERGE ANALYSIS

Ramp merge and diverge operations were also evaluated for Opening Year Cumulative (2019) conditions and the results of this analysis are presented in Table 6-5. As shown in Table 6-5, the following additional merge and diverge areas are anticipated operate at LOS E or LOS F for Opening Year Cumulative (2019) Without and With Project, in addition to those previously identified under Existing and E+P traffic conditions:

- SR-71 Freeway, Southbound Loop On-Ramp at Euclid Av. (SR-83) (Upstream) (#1) – LOS E AM peak hour only
- SR-71 Freeway, Southbound Loop On-Ramp at Euclid Av. (SR-83) (Downstream) (#2) – LOS E AM peak hour only
- SR-71 Freeway, Northbound Off-Ramp at Euclid Av. (SR-83) (#3) – LOS E AM and PM peak hours
- I-15 Freeway, Southbound Off-Ramp at Cantu Galleano Ranch Rd. (#8) – LOS E AM and PM peak hours
- I-15 Freeway, Northbound Off-Ramp at Limonite Av. (#11) – LOS E AM and PM peak hours

Opening Year Cumulative (2019) Without and With Project freeway ramp junction operations analysis worksheets are provided in Appendices 6.9 and 6.10, respectively.

6.10 RECOMMENDED IMPROVEMENTS

6.10.1 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES AT INTERSECTIONS

Improvement strategies have been recommended at intersections that have been identified as significantly impacted by the Project, in an effort to reduce each location's peak hour delay and improve the associated LOS grade to an acceptable LOS (LOS D or better). Significant impacts have been identified at deficient intersections if the Project contributes 50 or more peak hours or if the addition of Project traffic increases the delay by 5.0 seconds or more (for the intersections in Eastvale only).

The effectiveness of the recommended improvement strategies discussed below to address Opening Year Cumulative (2019) traffic deficiencies is presented in Table 6-6. Worksheets for Opening Year Cumulative (2019) Without and With Project conditions, with improvements, HCM calculation worksheets are provided in Appendix 6.11 and Appendix 6.12.

6.10.2 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON ROADWAY SEGMENTS

As shown on Table 6-6, the Opening Year Cumulative peak hour analysis indicates that the adjacent study area intersections on either side of the deficient roadway segments are anticipated to operate at acceptable LOS with the recommended intersection improvements shown. These intersection improvements consist of installation of traffic signals, additional turn lanes, additional through lanes, and traffic signal modifications to accommodate right turn overlap phasing. Table 6-7 shows the LOS for each of the applicable roadway segments with improvements consistent with those shown on Table 6-6 for the adjacent study area intersections, where roadway widening through additional through lanes has been recommended. In other words, only the roadway segments adjacent to study area intersections where additional through lanes have been recommended on Table 6-6 are shown on Table 6-7. As shown on Table 6-7, all roadway segments shown are anticipated to improve in LOS to acceptable levels.

6.10.3 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON OFF-RAMP QUEUES

As shown previously on Table 6-3, there are no movements that are currently experiencing queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows with addition of Project traffic. However, Table 6-8 shows the queuing results with the proposed intersection improvements shown previously on Table 6-6. Worksheets for Opening Year Cumulative (2019) Without and With Project traffic conditions, with improvements, off-ramp queuing analysis are provided in Appendices 6.13 and 6.14, respectively.

Table 6-6

¹ When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.
L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; >> = Free Right Turn Lane; d = Defacto Right Turn Lane; 1 = Improvement

² Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

³ CSS = Cross-street Stop; AWS = All-Way Stop; TS = Traffic Signal; TS = Improvement

⁴ Includes modifying the coordinated cycle length from 90 seconds to 120 seconds.

⁵ Includes new lanes on the westbound approach, implementing split phase for the eastbound and westbound approaches, and removing the eastbound (south leg) crosswalk.

Table 6-7

Roadway Segment Capacity Analysis for Opening Year Cumulative (2019) Conditions With Improvements

#	Roadway	Segment Limits	Roadway Section	LOS Capacity ¹	2019 Without Project	V/C ²	LOS ³	2019 With Project	V/C ²	LOS ³	Acceptable LOS
1	Merrill Avenue	East of Euclid Av. (SR-83)	4D	28,000	18,516	0.66	B	19,114	0.68	B	D
2		Between Grove Av. and Vineyard Av.	4D	28,000	19,912	0.71	C	20,734	0.74	C	D
3		West of Driveway 2 ⁴	4D	35,000	26,376	0.75	C	27,290	0.78	C	D
4	Archibald Avenue	North of Ontario Ranch Rd.	6D	53,900	36,227	0.67	B	37,266	0.69	B	D
5		Between Eucalyptus Av. and Merrill Av.	6D	53,900	39,133	0.73	C	41,083	0.76	C	D
6		North of the County Line	6D	53,900	46,665	0.87	D	48,002	0.89	D	D

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

¹ These maximum roadway capacities have been obtained from the City of Ontario's General Plan.

² V/C = Volume to Capacity Ratio

³ LOS = Level of Service

⁴ Additional capacity provided along the Project's frontage via turn lanes.

Table 6-8

Peak Hour Freeway Off-Ramp Queuing Summary for Opening Year Cumulative (2019) Conditions With Improvements

Intersection	Movement	Available Stacking Distance (Feet)	2019 Without Project				2019 With Project			
			95th Percentile Queue (Feet) ³		Acceptable? ¹		95th Percentile Queue (Feet) ³		Acceptable? ¹	
			AM Peak Hour	PM Peak Hour	AM	PM	AM Peak Hour	PM Peak Hour	AM	PM
Archibald Avenue/ SR-60 WB Ramps	WBL	1,389	294	377 ²	Yes	Yes	310	387 ²	Yes	Yes
	WBL/T	1,312	293	338	Yes	Yes	308	347	Yes	Yes
	WBR	250	619 ²	58	Yes ³	Yes	621 ²	58	Yes ³	Yes
I-15 SB Ramps / Limonite Avenue	SBL	400	173	200	Yes	Yes	173	200	Yes	Yes
	SBL/T/R	400	390 ²	503 ²	Yes	Yes ³	401 ²	503 ²	Yes	Yes ³
	SBR	1,200	351 ²	464 ²	Yes	Yes	362 ²	464 ²	Yes	Yes

¹ Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

² 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

³ Although 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the SR-60, SR-71, or I-15 Freeway mainline.

6.10.4 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON FREEWAY FACILITIES

At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development projects in the City of Ontario (or other neighboring jurisdictions) on SHS roadway segments. As such, no improvements have been recommended to address the Opening Year Cumulative (2019) deficiencies on the SHS, because there is no feasible mitigation available.

7 HORIZON YEAR (2040) TRAFFIC CONDITIONS

This section discusses the methods used to develop Horizon Year (2040) Without and With Project traffic forecasts, and the resulting intersection operations, freeway mainline operations, and traffic signal warrant analyses.

7.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for Horizon Year (2040) conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for Horizon Year conditions only (e.g., intersection and roadway improvements along the Project's frontage and driveways).
- Driveways and those facilities assumed to be constructed by cumulative developments to provide site access are also assumed to be in place for Horizon Year conditions only (e.g., intersection and roadway improvements along the cumulative development's frontages and driveways such as the northern extension of Meadow Valley Avenue on Kimball Avenue and the northern extension of Hellman Avenue north of Kimball Avenue).
- The Pine Avenue extension between its El Prado Road and the SR-71 Freeway.
- Other parallel facilities, that although not evaluated for the purposes of this analysis, are anticipated to be in place for Horizon Year traffic conditions and would affect the travel patterns within the study area (e.g., new future roadways within the New Model Colony area such as Schaefer Avenue east of Archibald Avenue, Eucalyptus Avenue east of Archibald Avenue, Merrill Avenue east of Archibald Avenue, The Preserve Specific Plan roadway network within the City of Chino, etc.).

7.2 HORIZON YEAR (2040) WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes the refined post-process volumes obtained from the SBTAM (see Section 4.7 *Horizon Year (2040) Volume Development* of this TIA for a detailed discussion on the post-processing methodology). The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year (2040) Without Project traffic conditions are shown on Exhibits 7-1 and 7-2, respectively.

7.3 HORIZON YEAR (2040) WITH PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes the refined post-process volumes obtained from the SBTAM, plus the traffic generated by the proposed Project (see Section 4.7 *Horizon Year (2040) Volume Development* of this TIA for a detailed discussion on the post-processing methodology). Horizon Year (2040) With Project traffic forecasts reflects buildout of the Project (i.e., traffic associated with PA1, PA2, and PA3). The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year (2040) With Project traffic conditions are shown on Exhibits 7-3 and 7-4, respectively.

LEGEND:

10(10) = AM(PM) PEAK HOUR INTERSECTION VOLUMES

7.4 INTERSECTION OPERATIONS ANALYSIS

7.4.1 HORIZON YEAR (2040) WITHOUT PROJECT TRAFFIC CONDITIONS

LOS calculations were conducted for the study intersections to evaluate their operations under Horizon Year (2040) Without Project conditions with roadway and intersection geometrics consistent with Section 7.1 *Roadway Improvements*. As shown in Table 7-1, the following additional study area intersections are anticipated to operate at an unacceptable LOS under Horizon Year (2040) Without Project traffic conditions, in addition to the intersections previously identified under Existing, E+P, and Opening Year Cumulative (2019) traffic conditions:

- Archibald Av. / SR-60 Eastbound Ramps (#15) – LOS E AM peak hour; LOS F PM peak hour
- Archibald Av. / Chino Av. (#18) – LOS F PM peak hour only
- Archibald Av. / Eucalyptus Av. (#21) – LOS F AM peak hour only
- Sumner Av. / Limonite Av. (#29) – LOS E AM peak hour; LOS F PM peak hour
- Scholar Wy. / Limonite Av. (#30) – LOS E AM peak hour only
- I-15 Northbound Ramps / Cantu Galleano Ranch Rd. (#36) – LOS E AM peak hour; LOS F PM peak hour
- I-15 Northbound Ramps / Limonite Av. (#37) – LOS E AM and PM peak hours

A summary of the peak hour intersection LOS for Horizon Year (2040) Without Project conditions is shown on Exhibit 7-5. The intersection operations analysis worksheets for Horizon Year (2040) Without Project traffic conditions are included in Appendix 7.1 of this TIA.

7.4.2 HORIZON YEAR (2040) WITH PROJECT TRAFFIC CONDITIONS

As shown on Table 7-1 and illustrated on Exhibit 7-6, there are no additional study area intersections anticipated to experience unacceptable LOS with the addition of Project traffic during one or more peak hours. The intersection operations analysis worksheets for Horizon Year (2040) With Project traffic conditions are included in Appendix 7.2 of this TIA.

7.5 ROADWAY SEGMENT CAPACITY ANALYSIS

As noted previously, the roadway segment capacities are approximate figures only, and are typically used at the General Plan level to assist in determining the roadway functional classification (number of through lanes) needed to meet future forecasted traffic demand.

Table 7-2 provides a summary of the Horizon Year (2040) conditions roadway segment capacity analysis based on the City of Ontario General Plan Roadway Segment Capacity Thresholds identified previously on Table 2-3. As shown on Table 7-2, all of the study area roadway segments are anticipated to operate at unacceptable LOS (based on daily roadway segment capacities) under Horizon Year (2040) Without and With Project traffic conditions.

Table 7-1

Intersection Analysis for Horizon Year (2040) Conditions

#	Intersection	Traffic Control ²	2040 Without Project				2040 With Project				Acceptable LOS	Significant Impact? ³

BOLD = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

¹ Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

² CSS = Cross-street Stop; AWS = All-Way Stop; TS = Traffic Signal; **CSS** = Improvement

³ Improvements currently under construction and anticipated to be completed by mid to late 2017 have been assumed to be in place.

Table 7-2

Roadway Segment Capacity Analysis for Horizon Year (2040) Conditions

#	Roadway	Segment Limits	Roadway Section	LOS Capacity ¹	2040 Without Project	V/C ²	LOS ³	2040 With Project	V/C ²	LOS ³	Acceptable LOS
1	Merrill Avenue	East of Euclid Av. (SR-83)	2U	14,000	19,441	1.39	F	20,051	1.43	F	D
2		Between Grove Av. and Vineyard Av.	2U	14,000	20,907	1.49	F	21,677	1.55	F	D
3		West of Driveway 2	2U	14,000	27,695	1.98	F	28,755	2.05	F	D
4	Archibald Avenue	North of Ontario Ranch Rd.	4D	35,900	40,720	1.13	F	41,942	1.17	F	D
5		Between Eucalyptus Av. and Merrill Av.	4D	35,900	45,932	1.28	F	48,084	1.34	F	D
6		North of the County Line	2D	17,950	47,201	2.63	F	48,716	2.71	F	D

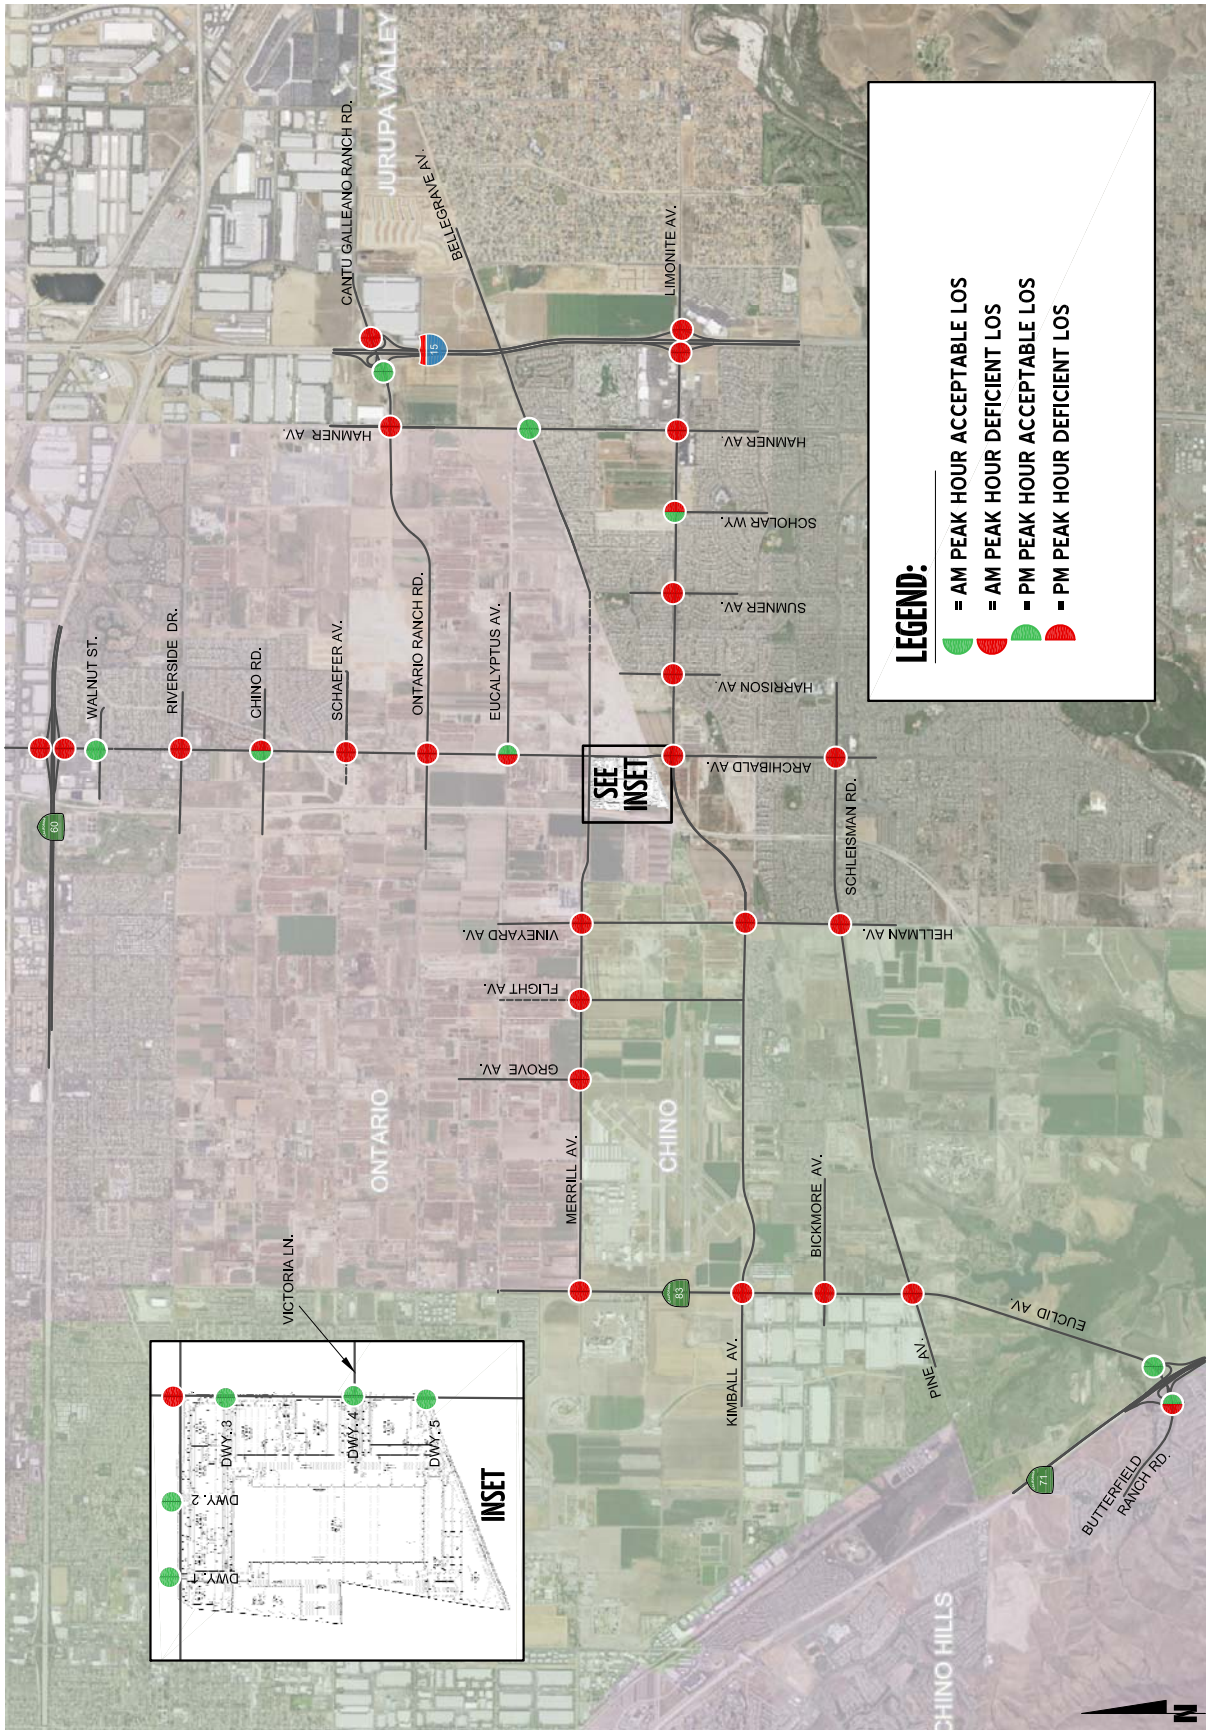

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

¹ These maximum roadway capacities have been obtained from the City of Ontario's General Plan.

² V/C = Volume to Capacity Ratio

³ LOS = Level of Service

EXHIBIT 7-6: SUMMARY OF LOS FOR HORIZON YEAR (2040) WITH PROJECT CONDITIONS

A peak hour assessment of intersections located on either side of a deficient roadway segment has been conducted to determine if peak hour traffic flows can be accommodated by the potentially deficient roadway segment. If it is determined that peak traffic flows can be accommodated at the City's stated LOS thresholds, then roadway segment widening is typically not recommended.

7.6 TRAFFIC SIGNAL WARRANTS ANALYSIS

The intersection of Archibald Avenue and Schaefer Avenue intersections are anticipated to meet ADT based traffic signal warrants for Horizon Year (2040) Without Project traffic conditions in addition to those previously warranted under Existing, E+P, and Opening Year Cumulative (2019) traffic conditions (see Appendix 7.3). No traffic signal warrant analysis was performed for Horizon Year (2040) With Project traffic conditions as all unsignalized study area intersections are warranted in a previous scenario.

7.7 OFF-RAMP QUEUING ANALYSIS

Queuing analysis findings for Horizon Year (2040) traffic conditions are presented in Table 7-3. As shown on Table 7-3, there are no movements that are anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows with the addition of Project traffic. Worksheets for Horizon Year (2040) traffic conditions off-ramp queuing analysis are provided in Appendices 7.4 and 7.5.

7.8 BASIC FREEWAY SEGMENT ANALYSIS

Horizon Year (2040) mainline directional volumes for the AM and PM peak hours are provided on Exhibits 7-7 and 7-8. As shown on Table 7-4, the following freeway segments analyzed for this study are anticipated to operate at an unacceptable LOS (i.e., LOS E or worse) during the peak hours, in addition to those previously identified in Opening Year Cumulative (2019) traffic conditions:

- SR-71 Freeway Northbound, South of Euclid Av. (SR-83) (#2) – LOS F AM and PM peak hours
- SR-60 Freeway Eastbound, West of Archibald Av. (#5) – LOS E AM and PM peak hours
- SR-60 Freeway Eastbound, East of Archibald Av. (#6) – LOS E AM and PM peak hours

There are no additional freeway segments that are anticipated to operate at an unacceptable LOS during the peak hours with the addition of Project traffic conditions. Horizon Year (2040) Without and With Project basic freeway segment analysis worksheets are provided in Appendix 7.6 and 7.7, respectively.

Table 7-3

¹ Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

² 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

³ Although 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the SR-60, SR-71, or I-15 Freeway mainline.

7.9 FREEWAY MERGE/DIVERGE ANALYSIS

Ramp merge and diverge operations were also evaluated for Horizon Year Cumulative (2040) conditions and the results of this analysis are presented in Table 7-5. As shown in Table 7-5, there are no merge and diverge areas anticipated to operate at LOS E or LOS F for Horizon Year (2040) Without Project, in addition to those previously identified under Existing, E+P, and Opening Year Cumulative (2019) traffic conditions.

There are no additional merge and diverge areas that are anticipated to operate at an unacceptable LOS during the peak hours with the addition of Project traffic. Horizon Year Cumulative (2040) Without and With Project freeway ramp junction operations analysis worksheets are provided in Appendices 7.8 and 7.9, respectively.

7.10 HORIZON YEAR (2040) DEFICIENCIES AND RECOMMENDED IMPROVEMENTS

7.10.1 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES AT INTERSECTIONS

Improvement strategies have been recommended at intersections that have been identified as significantly impacted by the Project, in an effort to reduce each location's peak hour delay and improve the associated LOS grade to an acceptable LOS (LOS D or better). Significant impacts have been identified at deficient intersections if the Project contributes 50 or more peak hours or if the addition of Project traffic increases the delay by 5.0 seconds or more (for the intersections in Eastvale only).

The effectiveness of the recommended improvement strategies discussed below to address Horizon Year (2040) traffic deficiencies is presented in Table 7-6 for both the Without and With Limonite Avenue Extension alternatives.

The Project Applicant shall participate in the funding of off-site improvements, including traffic signals that are needed to serve cumulative traffic conditions through the payment of City of Ontario DIF (if the improvements are included in the DIF program) or on a fair share basis (if the improvements are not included in the DIF program). These fees shall be collected by the City of Ontario, with the proceeds solely used as part of a funding mechanism aimed at ensuring that regional highways and arterial expansions keep pace with the projected population increases. Each of the improvements shown on Table 7-5 have been identified as being included as part of City DIF fee program or fair share contribution in Section 1.5 *Local and Regional Funding Mechanisms* of this TIA.

Worksheets for Horizon Year (2040) Without and With Project conditions, with improvements, HCM calculation worksheets are provided in Appendix 7.10 and Appendix 7.11, respectively.

¹ When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes
L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; >> = Free Right Turn Lane; d= Defacto Right Turn Lane; 1 = Improvement

² Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

³ CSS = Cross-street Stop; AWS = All-Way Stop; TS = Traffic Signal; TS = Improvement

⁴ Includes modifying the coordinated cycle length from 90 seconds to 120 seconds.

⁵ Recommended improvement consists of restriping the EB shared left-through lane as a shared left-through-right turn lane.

⁶ Improvements are consistent with planned partial cloverleaf interchange.

⁷ No physical improvement required. Recommendation is to increase the cycle length during the peak hours to 120 seconds.

7.10.2 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON ROADWAY SEGMENTS

As shown on Table 7-6, the Horizon Year peak hour analysis indicates that the adjacent study area intersections on either side of the deficient roadway segments are anticipated to operate at acceptable LOS with the recommended intersection improvements shown. These intersection improvements consist of installation of traffic signals, additional turn lanes, additional through lanes, and traffic signal modifications to accommodate right turn overlap phasing. Table 7-7 shows the LOS for each of the applicable roadway segments with improvements consistent with those shown on Table 7-6 for the adjacent study area intersections, where roadway widening through additional through lanes has been recommended. In other words, only the roadway segments adjacent to study area intersections where additional through lanes have been recommended on Table 7-6 are shown on Table 7-7. As shown on Table 7-7, although most roadway segments shown are anticipated to improve in LOS to acceptable levels, there is 1 deficient roadway segment (Archibald Avenue north of the County Line) with the recommended roadway segment improvements, however, roadway segment widening does not appear necessary to address the deficiencies at the identified roadway segments based on the peak hour intersection operations analysis shown on Table 7-6.

7.10.3 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON OFF-RAMP QUEUES

Table 7-8 shows the queuing results with the proposed intersection improvements shown previously on Table 7-6. As shown, there are no movements that are anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows with the addition of Project traffic. Worksheets for Horizon Year (2040) Without and With Project traffic conditions, with improvements, off-ramp queuing analysis are provided in Appendices 7.12 and 7.13, respectively.

7.10.4 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON FREEWAY FACILITIES

The Final Transportation Report for the California State Route 60 Freeway (prepared by Caltrans in July 2005), includes the construction of an additional high-occupancy vehicle (HOV) lane in each direction of the SR-60 Freeway and the construction of two truck by-pass lanes within the vicinity of the Archibald Avenue interchange. (11) Improvements along the I-15 Freeway near the vicinity of Cantu Galleano Ranch Road and Limonite Avenue include the addition of one to two tolled express lanes in each direction between the SR-60 Freeway and Cajalco Road. At the time of study preparation, an analysis of the future planned improvements along the SR-71 Freeway was not readily available (i.e., no study has been conducted to date). As such, no additional analysis has been performed for these freeway mainline segments and ramp merge/diverge junctions and no improvements are assumed within this analysis.

Table 7-7

Roadway Segment Capacity Analysis for Horizon Year (2040) Conditions With Improvements

#	Roadway	Segment Limits	Roadway Section	LOS Capacity ¹	2040 Without Project	V/C ²	LOS ³	2040 With Project	V/C ²	LOS ³	Acceptable LOS
1	Merrill Avenue	East of Euclid Av. (SR-83)	4D	28,000	19,441	0.69	B	20,051	0.72	C	D
2		Between Grove Av. and Vineyard Av.	4D	28,000	20,907	0.75	C	21,677	0.77	C	D

	SBL/T/R	400	234	257	Yes	Yes	242	265	Yes	Yes
	SBR	1,200	117	239	Yes	Yes	118	246	Yes	Yes

¹ Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

² 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

³ Although 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the SR-60, SR-71, or I-15 Freeway mainline.

Caltrans typically assumes a reduction of fourteen percent to the freeway mainline through volumes in this region to account for vehicles utilizing the carpool (high-occupancy vehicle) lanes. The reduction to the SR-60 and I-15 Freeway mainline volumes has been applied to account for the proposed HOV/Express Toll lanes and truck bypass lanes. The analysis has been performed assuming the same number of mixed-flow lanes and on and off-ramp configurations as existing baseline conditions at the SR-60 Freeway at Euclid Avenue (SR-83) and I-15 Freeway at Limonite Avenue interchanges. Reductions to mainline volumes have been taken into account for the HOV/Express Toll lanes and truck bypass lanes, but HCM analyses for the freeway facility only considers the mixed-flow lanes.

As shown on Table 7-9, the SR-60 and I-15 Freeway mainline segments are anticipated to operate at an acceptable LOS with the improvements discussed above. Table 7-10 shows that the following SR-60 and I-15 Freeway ramp junctions are anticipated to continue to operate at an unacceptable LOS with the improvements discussed above (i.e., LOS E or worse), although they are anticipated to operate at an improved density as compared to the “without improvement” condition:

- SR-60 Freeway, Eastbound, Off-Ramp at Archibald Avenue (#6) – LOS E AM peak hour only
- I-15 Freeway, Southbound Off-Ramp at Limonite Av. (#8) – LOS E AM peak hour only
- I-15 Freeway, Southbound On-Ramp at Limonite Av. (#9) – LOE AM peak hour only

Worksheets for Horizon Year (2040) Without and With Project conditions freeway mainline level of service analysis, with improvements, are provided in Appendix 7.14 and Appendix 7.15. Horizon Year (2040) Without and With Project freeway ramp junction level of service analysis worksheets, with improvements, are provided in Appendix 7.16 and Appendix 7.17.

APPENDIX 1.1:

APPROVED TRAFFIC STUDY SCOPING AGREEMENT

This Page Intentionally Left Blank

December 15, 2016

Mr. Larry Tay
City of Ontario
303 E. B Street
Ontario, CA 91764

SUBJECT: SCOPING ASSUMPTIONS FOR THE COLONY COMMERCE CENTER EAST TRAFFIC IMPACT ANALYSIS

Dear Mr. Larry Tay:

The firm of Urban Crossroads, Inc. is pleased to submit this letter documenting the recommended scoping assumptions for the proposed Colony Commerce Center East (“Project”), which is located on the southwest corner of Archibald Avenue and Merrill Avenue in the City of Ontario. Urban Crossroads, Inc. has calculated trip generation, evaluated trip distribution patterns, and the recommended analysis locations. It is our understanding that the Project is to consist of up to 998,680-square foot (sf) high-cube warehouse/distribution center building (Building 9) and 8 smaller buildings totaling 673,810-sf (Buildings 1 through 8). 25 percent of the total building square footage for Buildings 1-8 is assumed to be manufacturing use, while the remaining 75 percent is assumed to be general warehouse use. The proposed Project is anticipated to be developed in a single phase with a projected Project Buildout of 2018.

PROJECT DESCRIPTION

Exhibit 1 illustrates the preliminary Project site plan. The proposed Project is part of the Colony Commerce East Specific Plan. The proposed Project is contained within Planning Area (PA) 1 and PA2 of the Specific Plan. The remaining PA3 (highlighted and identified as the Katob Property) is not a part of this Project and is proposed to be developed with up to 231,195 square feet of industrial use in the future. As indicated on Exhibit 1, the total development is proposed to consist of up to 168,453-sf of manufacturing use (25 percent of Buildings 1 through 8), 505,358-sf of warehousing use (75 percent of Buildings 1 through 8), and 998,680-sf high-cube warehouse/distribution center use (Building 9). Vehicular and truck traffic access will be provided via the following driveways (see Exhibit 1):

- Driveway 1 / Merrill Avenue – Right-in/right-out driveway providing access to both passenger cars and trucks for Buildings 1, 2, and 9
- Driveway 2 / Merrill Avenue – Full access driveway providing access to both passenger cars and trucks for Buildings 3, 4, 5, 6, and 9
- Archibald Avenue / Driveway 3 – Right-in/right-out driveway providing access to passenger cars and trucks for Buildings 5, 6, and 9

- Archibald Avenue / Driveway 4 – Full access driveway providing access to both passenger cars and trucks for Buildings 6, 7, 8, and 9
- Archibald Avenue / Driveway 5 – Right-in/right-out driveway providing access to passenger cars and trucks for Buildings 8 and 9

Exhibit 2 illustrates the proposed study area and study area intersections. As indicated on Exhibit 2, the proposed development is located between Kimball Avenue and Bickmore Avenue on either side of the future Mayhew Avenue in the City of Ontario. The Project is approximately 3.3 miles south of State Route 60 (SR-60) Interchange on Archibald Avenue and approximately 3.0 miles west of Interstate 15 (O-15) Freeway on Limonite Avenue.

EXISTING ANALYSIS

As shown on Exhibit 2, most of the traffic counts within the study area were collected in either in the end of April or early May of 2016. A 1 percent growth is proposed to be added to these April/May 2016 traffic counts to represent Existing (2017) traffic conditions. For the locations where counts were collected in December 2016, no growth will be applied to reflect Existing (2017) traffic conditions.

OPENING YEAR ANALYSIS

Consistent with other traffic studies performed in the area, an Existing plus Project (E+P) condition analysis will be performed to determine the Project's direct impacts:

- Existing plus Project (Buildout)

To assess potential cumulative traffic impacts, Opening Year scenarios (identified below) will be evaluated in the traffic study:

- Opening Year Cumulative (2018) Without Project
- Opening Year Cumulative (2018) With Project

Other cumulative development projects will be manually added in conjunction with an ambient (background) growth factor for each of the Opening Year Cumulative analysis scenarios. Where applicable, 100% of the cumulative development projects that are either under construction or would be completed by 2018 would be included as opposed to the proposed absorption percentage. We are proposing the following absorption rate be applied to the remaining cumulative projects: 30% for 2018.

HORIZON YEAR (2040) ANALYSIS

The Horizon Year (2040) traffic volume forecasts will be based on data obtained from the San Bernardino Traffic Analysis Model (SBTAM) using accepted procedures for model forecast refinement and smoothing with the exception of study area intersections located in Riverside County. Horizon Year forecasts for

study area intersections located within the County of Riverside will be derived from the Riverside County Transportation Analysis Model (RivTAM).

The Katob Property (PA3 of the Colony Commerce East Specific Plan) will be included for Horizon Year (2040) traffic conditions only. The site is assumed to consist of up to 231,195 square feet of industrial use. The site will take access to Archibald Avenue via Driveway 5 (access road located along the Project's southern boundary).

The Horizon Year (2040) traffic forecasts for the study area will be based on existing peak hour traffic count data and raw model output data. Data will be obtained from the SBTAM and RivTAM for the Without Project scenario. The following Horizon Year (2040) scenarios will be evaluated in the traffic study:

- Horizon Year (2040) Without Project
- Horizon Year (2040) With Project

TRIP GENERATION

Trip generation represents the amount of traffic that is attracted and produced by a development, and is based upon the specific land uses planned for a given project. Trip generation rates for the Project are shown in Table 1 for both passenger car equivalent (PCE) and actual vehicles. The trip generation summary illustrating daily and peak hour trip generation estimates for the proposed Project in PCE are shown on Table 2, and Table 3 shows the trip generation summary based on actual vehicles. The trip generation rates used for this analysis are based upon information collected by the Institute of Transportation Engineers (ITE) as provided in their *Trip Generation* manual, 9th Edition, 2012.

For purposes of this analysis, the following ITE land use codes and vehicle mixes have been utilized:

- ITE land use code 140 (Manufacturing) has been used to derive site specific trip generation estimates for up to 25 percent of the total square footage for Buildings 1 through 8. The ITE *Trip Generation* manual includes very limited data regarding the types of vehicles that are generated for manufacturing uses (passenger cars and various sizes of trucks). As such, data regarding the vehicle mix has been obtained from a separate report; the City of Fontana *Truck Trip Generation Study* (August 2003) for the manufacturing uses proposed as part of the Project. Buildings 1 through 8 have been identified as manufacturing. The "Light Industrial" vehicle mix data has been utilized as a vehicle mix for manufacturing is not readily available.
- ITE land use code 150 (Warehousing) has been used to derive site specific trip generation estimates for up to 75 percent of the total square footage for Buildings 1 through 8. The ITE *Trip Generation* manual includes very limited data regarding the types of vehicles that are generated for warehousing uses (passenger cars and various sizes of trucks). Data regarding the vehicle mix

has therefore been obtained from a separate report; the City of Fontana *Truck Trip Generation Study* (August 2003) for the warehousing use proposed as part of the Project. The “Heavy Warehouse” vehicle mix data has been utilized for all 4 buildings.

- ITE land use code 152 (High-Cube Warehousing) has been used to derive site specific trip generation estimates for Building 9. Total vehicle mix percentages were also obtained from the ITE *Trip Generation* manual in conjunction with the South Coast Air Quality Management District’s (SCAQMD) recommended truck mix, by axle type. The SCAQMD is currently recommending the use of the ITE *Trip Generation* manual in conjunction with their truck mix by axle-type to better quantify trip rates associated with local warehouse and distribution projects, as truck emission represent more than 90 percent of air quality impacts from these projects. This recommended procedure has been utilized for the purposes of this analysis in effort to be consistent with other technical studies being prepared for the Project. The percentage of trucks has been determined from the table shown on page 267 of the ITE *Trip Generation* manual. As shown on page 267, the truck trip generation rate for weekday daily traffic is 0.64 or 38.1% of the total traffic. Similarly, the truck trip generation rate for the weekday AM peak hour is 0.03 (27.3% of the total traffic) and 0.04 (or 33.3% of the total traffic) for the weekday PM peak hour. Trip generation for heavy trucks was further broken down by truck type (or axle type). The total truck percentage is comprised of 3 different truck types: 2-axle, 3-axle, and 4+-axle trucks. For the purposes of this analysis, the percentage of trucks, by axle type, were obtained from the SCAQMD interim recommended truck mix. The SCAQMD has recently performed surveys of existing facilities and compiled the data to provide interim guidance on the mix of heavy trucks for these types of high-cube warehousing/distribution facilities. Based on this interim guidance from the SCAQMD, the following truck fleet mix was utilized for the purposes of estimating the truck trip generation for the site: 22.0% of the total trucks as 2-axle trucks, 17.7% of the total trucks as 3-axle trucks, and 60.3% of the total trucks as 4+-axle trucks.

Finally, PCE factors were applied to the trip generation rates for heavy trucks (large 2-axles, 3-axles, 4+-axles). PCEs allow the typical “real-world” mix of vehicle types to be represented as a single, standardized unit, such as the passenger car, to be used for the purposes of capacity and level of service analyses. The PCE factors are consistent with the recommended PCE factors in Appendix B of the San Bernardino County Congestion Management Program (CMP), 2016 Update.

As shown on Table 2, the proposed Project is anticipated to generate a net total of 11,218 PCE trip-ends per day, 1,113 PCE AM peak hour trips and 1,174 PCE PM peak hour trips. In comparison, the proposed Project is anticipated to generate a net total of 9,217 actual vehicle trip-ends per day with 869 AM peak hour trips and 914 PM peak hour trips (see Table 3).

TRIP DISTRIBUTION

The Project trip distribution and assignment process represents the directional orientation of traffic to and from the Project site. The trip distribution pattern of passenger cars is heavily influenced by the geographical location of the site, the location of surrounding uses, and the proximity to the regional freeway system. The trip distribution pattern for truck traffic is also influenced by the local truck routes approved by the City of Ontario, City of Chino, City of Chino Hills, City of Eastvale, and the California Department of Transportation (Caltrans). Given these differences, separate trip distributions were generated for both passenger cars and truck trips.

The Opening Year Cumulative distribution patterns utilize the existing roadway system in relation to the Horizon Year trip distribution patterns, which assumes future roadway connections. The Project trip distribution patterns are also affected by near-term development patterns in the vicinity of the Project site. The extension of Hellman Avenue north of Merrill Avenue, Carpenter Avenue north of Merrill Avenue, Schaefer Avenue at Archibald Avenue, Limonite Avenue/Kimball Avenue extension between Hellman Avenue and Archibald Avenue, and the Merrill Avenue extension to Bellegrave Avenue will also be assumed for Horizon Year conditions only.

Exhibit 3 illustrates the truck trip distribution patterns for Opening Year Cumulative and Horizon Year conditions. As shown on Exhibit 3, trucks are anticipated to utilize designated truck routes such as Merrill Avenue, Euclid Avenue (SR-83), Archibald Avenue, Edison Avenue/Ontario Ranch Road, and Limonite Avenue to reach regional freeways such as the SR-71, SR-60, and I-15 Freeways. These travel patterns are not anticipated to change with the addition of new future facilities for Horizon Year traffic conditions. Exhibit 4 illustrates the Opening Year Cumulative passenger car trip distribution patterns. The Opening Year Cumulative passenger car trip distribution patterns are based on a SBTAM select zone run for the zone containing the Project, with modifications to utilize the existing roadways only.

Exhibit 5 illustrates the passenger car trip distribution patterns for Horizon Year traffic conditions. The passenger car trip distribution patterns are based on a SBTAM select zone run for the zone containing the Project.

INTERSECTION ANALYSIS LOCATIONS

The Colony Commerce Center East traffic study will implement the San Bernardino Associated Governments (SANBAG) Congestion Management Program (CMP) for traffic impact analysis reports. CMP intersections, where applicable, are illustrated on Exhibit 2. The general preparation of the traffic impact study for this Project will continue to be in conformance with the typical requirements of the San Bernardino County CMP.

Exhibit 2 depicts the recommended intersection analysis locations, based upon the analysis in this scoping letter. The recommended local analysis locations are based on the highest Project traffic contribution presented for either Opening Year Cumulative or Horizon Year scenarios.

INTERSECTION ANALYSIS METHODOLOGY

For the purposes of this analysis, signalized intersection operations analysis will be based on the methodology described in Chapter 18 and 31 of the *Highway Capacity Manual (2010)*. Intersection LOS operations are based on an intersection's average control delay. A maximum cycle length of 120 seconds will be utilized. Unsignalized intersections will be evaluated using the methodology described in Chapter 19, Chapter 20, and Chapter 32 of the HCM 2010. At two-way or side-street stop-controlled intersections, LOS is calculated for each controlled movement and for the left turn movement from the major street, as well as for the intersection as a whole. For approaches composed of a single lane, the delay is computed as the average of all movements in that lane. For all-way stop controlled intersections, LOS is computed for the intersection as a whole.

Consistent with Appendix B of the San Bernardino County CMP, the following saturation flow rates, in vehicles per hour green per lane (vphgpl), will be utilized in the traffic analysis for signalized intersections:

Existing and Opening Year Cumulative Traffic Conditions:

- Exclusive through: 1800 vphgpl
- Exclusive left: 1700 vphgpl
- Exclusive right: 1800 vphgpl
- Exclusive dual left: 1600 vphgpl
- Exclusive triple left: 1500 vphgpl

Horizon Year (2040) Traffic Conditions:

- Exclusive through: 1900 vphgpl
- Exclusive left: 1800 vphgpl
- Exclusive dual left: 1700 vphgpl
- Exclusive right: 1900 vphgpl
- Exclusive dual right: 1800 vphgpl
- Exclusive triple left: 1600 vphgpl or less

LEVEL OF SERVICE (LOS) CRITERIA

The definitions of an operational deficiency for each of the applicable jurisdictions are as follows:

CITY OF ONTARIO

The City of Ontario utilizes a minimum acceptable LOS of LOS E.

CITY OF CHINO

According to the City of Chino, LOS D is the minimum acceptable condition that should be maintained during the peak commute hours. Therefore, any intersection operating at LOS E or F is considered deficient. LOS will also be reported by movement for the City's review.

CITY OF EASTVALE

The City of Eastvale General Plan Policy C-10 sets a standard of LOS C with LOS D as acceptable in commercial and employment areas and at intersections of any combination of major highways, urban arterials, secondary highways, or freeway ramps. Based on this criteria, LOS D is the minimum acceptable LOS at all study intersections in the City of Eastvale.

CMP

The CMP definition of deficiency is based on maintaining a level of service standard of LOS E or better, except where an existing LOS F condition is identified in the CMP document.

CALTRANS

For the study intersections at Caltrans freeway-to-arterial ramps, LOS D is the minimum acceptable condition that should be maintained during the peak commute hours.

SPECIAL ISSUES

The following special issues will be addressed in the traffic study:

- Truck turning templates will be used to address how Project truck traffic (e.g., large trucks such as a WB-67) would enter and exit the Project site to determine radii at curb returns, radii of streets per Highway Design Manual, and widths/radii required for on-site maneuvering for two-way truck traffic.
- Provide a queuing analysis for the Project driveways and site adjacent signalized intersections for Horizon Year (2040) traffic conditions to determine necessary storage lengths. Site plan and proposed driveway placement/median openings will need to be reviewed for locations and queuing of trucks/cars based on proximity to the intersection of Archibald Avenue/Merrill Avenue and distances to other driveways.
- Conduct a traffic signal warrant analysis for Driveway 2 and Merrill Avenue (ADT-based).
- "Fair-share" contributions for improvements within the City's DIF program and within in other jurisdictions will be included in the TIA.

CUMULATIVE DEVELOPMENT PROJECTS

Exhibit 6 illustrates a cumulative development location map. A summary of the cumulative development projects is shown on Table 4. Please review to let us know if there are any projects that should be

Mr. Larry Tay
City of Ontario
December 15, 2016
Page 8 of 8

removed or provide information on new cumulative projects that should be added. We will also reach out to the adjacent City of Chino, City of Chino Hills, and City of Eastvale, to obtain updated cumulative projects within their respective jurisdictions. Cumulative development projects will be utilized for evaluating Opening Year Cumulative traffic conditions, in conjunction with the addition of background growth (i.e., compounded growth of 2 percent per year over 1 year).

FEE PROGRAM

It is requested that the City provide a list of facilities that are included in the City's fee program.

SIGNAL TIMING

It is requested that the City of Ontario provide existing signal timing for intersections within their jurisdiction. Caltrans will also be contacted to obtain existing signal timing for facilities located within their jurisdiction. If existing signal timing is not available, default values consistent with the most current CA MUTCD guidelines will be utilized.

CONCLUSION

Urban Crossroads, Inc. is pleased to submit this letter documenting the Project trip generation, trip distribution, and the recommended intersection analysis locations for the Colony Commerce Center East Traffic Impact Analysis. We will continue to move forward towards completing the traffic study after receiving jurisdiction approval or comments finalizing the study area.

If you have any questions, please contact me directly at (949) 336-5978.

Respectfully submitted,

URBAN CROSSROADS, INC.

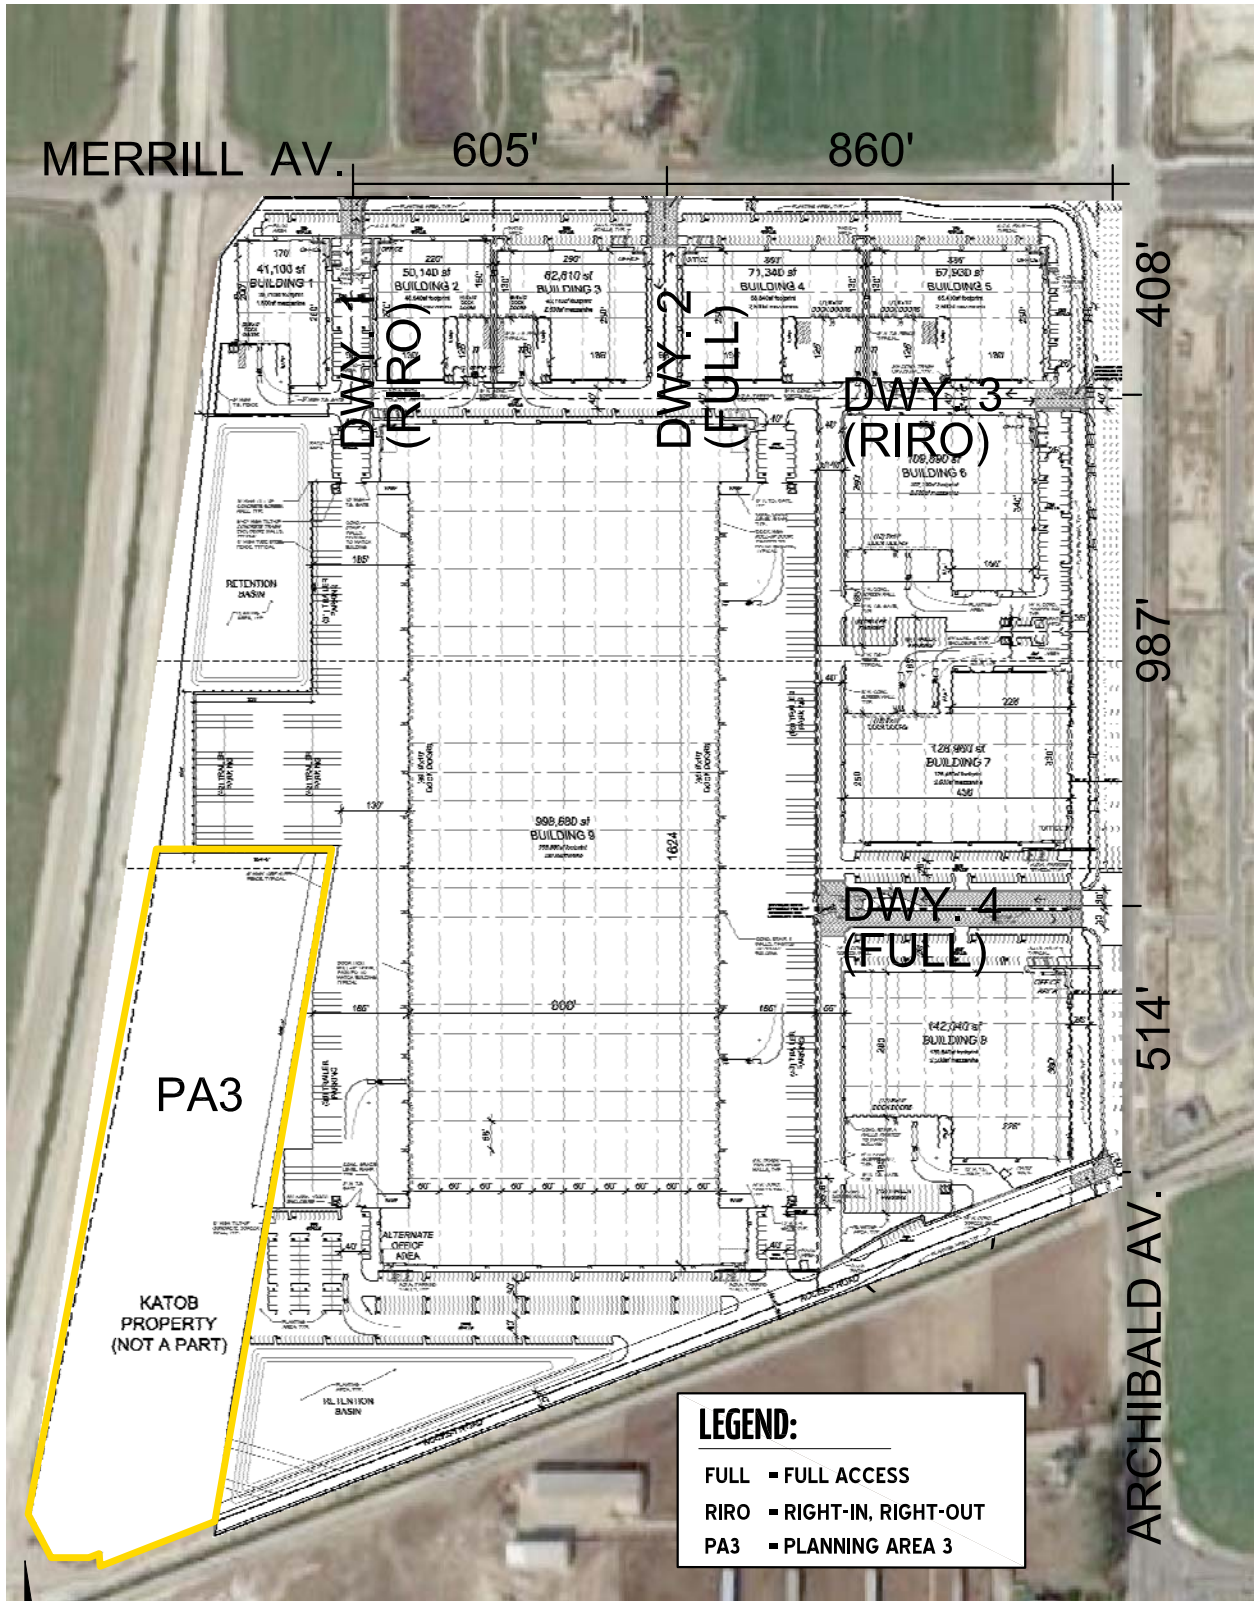

Aric Evatt, PTP
President

Charlene So, PE
Senior Transportation Engineer

This Page Intentionally Left Blank

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)

(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 64 km/h OR ABOVE 40 mph ON MAJOR STREET)

Traffic Conditions = Existing (2017) Conditions - Weekday AM Peak Hour

Major Street Name = Grove Avenue

Total of Both Approaches (VPH) = 742
 Number of Approach Lanes Major Street = 1

Minor Street Name = Merrill Avenue

High Volume Approach (VPH) = 180
 Number of Approach Lanes Minor Street = 1

WARRANTED FOR A SIGNAL

*Note: 100 vph applies as the lower threshold for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold for a minor-street approach with one lane

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)

(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 64 km/h OR ABOVE 40 mph ON MAJOR STREET)

Traffic Conditions = Existing (2017) Conditions - Weekday AM Peak Hour

Major Street Name = Flight Avenue

Total of Both Approaches (VPH) = 859
 Number of Approach Lanes Major Street = 1

Minor Street Name = Merrill Avenue

High Volume Approach (VPH) = 203
 Number of Approach Lanes Minor Street = 1

WARRANTED FOR A SIGNAL

*Note: 100 vph applies as the lower threshold for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold for a minor-street approach with one lane

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)

(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 64 km/h OR ABOVE 40 mph ON MAJOR STREET)

Traffic Conditions = Existing (2017) Conditions - Weekday AM Peak Hour

Major Street Name = Hellman Avenue

Total of Both Approaches (VPH) = 820
 Number of Approach Lanes Major Street = 1

Minor Street Name = Kimball Avenue

High Volume Approach (VPH) = 314
 Number of Approach Lanes Minor Street = 1

WARRANTED FOR A SIGNAL

*Note: 100 vph applies as the lower threshold for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold for a minor-street approach with one lane
